> Would it be possible to mount RS232 connector on one side and PS2
> connector on the other side? Mouse could be directly connected to
PeST.

Yes, that would be possible although possibly impractical. The PCB
mouse PS/2 connectors are a little tight so some concern about quality
control when we were speccing. The idea with the PS2 extension cable is
the any gubbins such as PS2/USB converters can be dropped down behind

the desk etc.

Had a choice of these or these;

http://www.maplin.co.uk/Module.aspx?ModuleNo=1111&doy=30m8

http://www.maplin.co.uk/Module.aspx?ModuleNo=1115&doy=30m8

The other option is to have a very short extension cable. Silly thing
is that the sockets up above are more expensive than a 2 metre ps2
extension cable which is chopped in half.

>
> Did you know, that the easter part of Budapest is called Pest?
>

I do now :-) Pest is the flat east side of the Danube. No significance
to Strauss by any chance.. Blue Danube... Mmmm, just done a few
searches, why yes I think it is :-)

mint@fishpool.com

Is their working e-mail address. Here is a link with instructions:

http://sparemint.atariforge.net/mailinglist/

The MiNT Mailing List

This is where discussions regarding FreeMiNT development take place. You may submit bug reports, inform people of your programming efforts, help others resolve problems with their setup, or simply learn more about the various distributions (e.g. KGMD, SpareMiNT) and packages by reading the posts.

To subscribe, send an e-mail to Fishpool's Majordomo with "subscribe mint" as the message's content, then follow the instructions sent back in response to your request.

To unsubscribe, send an e-mail to Fishpool's Majordomo with "unsubscribe mint" as the message's content. A confirmation will be sent back in response to your request.

Warning: Majordomo is strictly designed to handle subscribtion requests automatically. It will not forward your messages to the MiNT list!

Instructions for posting your messages to the list are provided in the confirmation message sent by Majordomo after your subscribtion request has been processed.

The MiNT Mailing List Archives

- MiNT mailing list.
  Archived from January 1993 onward.

The MiNT Mailing List on Google

The MiNT list is also accessible on Google.

I think people have managed to take a couple of different routes and still get things working. I've seen where MagiC! users have succeeded with STing. IMHO, still the best Atari environment and desktop would be MINT and Thing.

Definitely.

The original Atari style extension cables can still be bought, although
a little on the pricey side.

�6 for 3 metre cable
http://www.highstreetmicro.co.uk/pagedocs/Atari%20ST%20Bits.htm

�2.50 but Stack site dead http://www.oneswitch.org.uk/4/DIY/retro.htm

$8!!! http://www.connectworld.net/cgi-bin/iec/L1142

Galen, you're right. With it set the way I had it, I could ping localhost at 127.0.0.1, and I could ping the machine (even from another ip address on the LAN) at 192.168.0.104, and I could ping other machines from the Atari. However, no apps would work. CAB, NEWSIE, etc, just time out.

I reversed the 192.168.0.1 and the 192.168.0.104 in the ROUTE.TAB file and now CAB and NEWSIE work. I was able to load up Google. :-)

Thanks.

Okay, if you read my message to Galen, I had to reverse part of my ROUTE.TAB files settings, but once I did that, CAB and NEWSIE both work. I was able to load up the Google search site in CAB. Hurrah! :-)

> Did you check all the settings in STING? I would think that may have to do
> with your problem. What modules do you have in the STING folder?

Apparently this is not a STing problem. Its my BBS software. It doesn't access anything tcp/ip (if I'm using the right terminology here). It looks for signals from the serial port only. Thats why it works with the Lantronix UDS-10, which converts those signals. It appears at this time that a rewrite of the code itself would be required. I can still use the BBS via Telnet just like always, just not as fast as an EtherNEC would have allowed it. :-(

Thanks for the help though.

Okay, its all working but I have another question. What do you have to do to make the settings "stick"? I mean, after a poweroff or reboot, I have to go into the STing Port CPX and reset everything. I saved, both general and address to STING.PRT, in the C hard drive. Doesn't make a difference though, if I reboot, I have to use the CPX again.

Any ideas? Thanks!

Yes, if it fits, and if it's all lines are connected straight through.
The biggest issue is likely to be if the connector fits the ST without
chaffing on the case.

One way to find out :-)

images Are there for the test design. the full design will be a fraction
longer due to cable retention.

We was going to have at first the mouse connected direct to PeST, though the PS2 plug is too wide in general so the ST would end up resting ont he PS2 connector rather than the ST's feet. After a very quick chat to people, they prefered a extender cable anyway, of course we all like our port extenders so everyone is happy there.

Id you use a "though" cable will al 9 pins connected it can work... though a normal RS232 cable will not work, TX-RX and handshake lines will be crossed over and you will have a nice reversal of mouse movements.

I think Alison maybe making some "in cable" types for those who want to do that kinda thing. The board I am developing just plugs into the port under the keyboard as show on my site http://www.cps-electronics.co.uk/web/PS2.htm that is with a few inchs are PS2 extender cable.

hmmm, not sure if those plugs will fit... prossible... though the screws may
need to come off and its posible the plug itself coudl be to wide or too
long... A generic DB9 only *just* fits and thats without any plastic housing
around it.... I would bug Alison for those in lead adapters ;-)

Hi Janez!

I don't think that's right - Thing is not included in SETS.DAT! At
least it isn't in mine on the Falcon (though I use V1.29).

But if he is using MagiC, he will have to delete the line

  #_SHL C:\THING\THING.APP

(or whatever the path was - mine is in D:\THING\) in the MAGX.INF
file and possibly substitute an entry for an alternative desktop
if he isn't using MagiC's own.

If he is *not* using MagiC, then I don't know where the message
comes from. Perhaps a rename to OLDTHING rather than THINGXXX might
work?

Regards, /Peter/

Hi,

Xboot has a field name "Autostart" where u can select an application which will automaticaly start after boot.. If Thing is set ti Autostart, Xboot will complain that Thing cant be found...

Janez

Hi all,

I just uploaded <http://eureka.atari.org/xa-my-aes.zip>.

It's a versatile boot disk image for ARAnyM ... It means that it runs 2 AESes (XaAES & MyAeS) and that all is done to switch from one to the other easily ...

This image is compatible with AFROS disk image. That means that you can replace "disk.img" from AFROS and that all should work as ever :)

The new features are :

- EmuTOS snapshot from 2005-07-12
- upgraded configuration files
- freeMiNT snapshot from 2005-08-19
  that means fresh kernel and AES
- zView beta 6
- Teradesk 3.62
- MyAeS 0.68

Have fun !

Regards,

Since my OLR crashes when I try to do a Comment to Ed Baiz's
posted message <43119978862a04@comcast.net>, I am sending this as
a new Say:

>Yes, that is how I backed up my Mint System. I put together a lot of tar.gz
>files. Worked fine, but I would rather have something like CDISO or CDBackup
>do it.

For someone who is not Unix/Mint savvy, can someone please explain
to me why you need to use both tar and gz. What do they do
individually? I assume gz is GZIP and like any other ZIP, but what
does tar do?

And how do you handle *.tar.gz files under TOS/MagiC? Do you first
unzip them and then detar them? ArcView has facilities for both,
but in which order do you use them?

Thanks for any explanation!

Regards, /Peter/

tar creates an archive, without compressing the data. It appends all files and adds information so that it can detach them later.
gzip does the actual compressing. When using the GNU tar implementation (most likely the one for MiNT) one can combine these two operation into one.

> And how do you handle *.tar.gz files under TOS/MagiC? Do you first unzip them and then detar them? ArcView has facilities for both, but in which order do you use them?

With GNU tar one can decompress the archive and decompose the tar file in a single step:

```
tar zxf filename.tar.gz
```

This is the same as running

```
gunzip filename.tar.gz ; tar xf filename.tar
```

Note that in the one step process the original file is kept, whereas in the two step process the .tar.gz file is removed and replaced by the uncompressed .tar file.

tar archives a set of files in one tar-file, preserving access-bits, datestamps etc. It doesn't compress though. gzip is a (de)compression tool, but it can only compress one file.

Example:

```
tar cf drive_c.tar /c/*
```

will make an archive called drive_c.tar of your entire C-drive, but it won't compress anything. To compress this archive you can use gzip:

```
gzip drive_c.tar
```

This will also add a .gz-suffix to the archive. You can also do this in one step:

```
tar czf drive_c.tar.gz /c/*
```

> And how do you handle *.tar.gz files under TOS/MagiC? Do you first

> unzip them and then detar them? ArcView has facilities for both,
> but in which order do you use them?

To depack you first decompress the archive...

```
gunzip drive_c.tar.gz
```

...then unpack the archive:

```
tar xf drive_c.tar
```

Or in one step:

```
tar xzf drive_c.tar.gz
```

I thought I would add that gzip a way to compress a single file.
(A .zip file is a container of multiple files that is compressed - with

.tar.gz files the TAR is the container, and the GZIP part is the compression).

Coda.

Not really. In the Sting Port CPX file there is a save option. I just clicked
on that and it saved it to the hard drive. Try doing it a few times just to
make sure it does the job.

Under Magic I first use the gzip.ttp program (-d option). That will give me a tar file. I then use Arcview(which I have setup to work with the tar.ttp file) to get the files inside.

The Encyclopedia of Game.Machines

With 224 pages, 600+ full colour pictures, This is the ultimate
reference!

Exactly what it says! This is The Encyclopedia of Game Machines!!
Winnie Forster's unique and aesthetically perfect publication is
presented here in in the UK for the first time.
This book was officially launched at CGEUK 2005. All copies were
snapped up within minutes (literally)!

>From Atari to Sega, from Apple to Nintendo DS: The full colour book
takes not a regional, or European, but a global view on 33 years of
onscreen fun and interaction and presents hardware from Japan, USA, UK,
France, Germany and Korea, along with classic software in its
authentic, pixellated glory. Other than the 600+ pictures, exclusively
shot for the

Game.Machines book, it contains extensive indices, as well as 20 pages
of technical data and explanations.

Available in the UK now.

If I am not mistaken, there is only 1 version of WordPerfect that will
run on
the Falcon.

If this is correct, which version is it?

Hi everybody,

I just got an ITT TV2466 stereo tuner. It once was intended to watch TV with an Atari monitor. Unfortunately, I don't have an instructor manual.

Can you tell me anything about it?

In particular, I'm interested in the following:

- I would like to use the TV2466 limilar to a TV receiver of an VCR, where the eight channels are switched to the one channel of the TV tuner. Is this possible? How to find the channel of the tuner?

- What is the meaning of the LED's. OK, I guess the left one indicates that the tuner is set to a channel and the right one indicates mono/stereo. But what to the upper and the lower indicate?

Thanks, Uli

Atari Workshop in the UK.

Better, get the original floppies from the vendor!

Or back up the C drive and then copy back after you've formatted the drive.

Just as a reminder: Formatting a hard disk drive that has no bad sectors
is a waste of time. Partitioning is sufficient and much faster.
Formatting (always meaning low level formatting on the Atari) yields the
same result on any platform because it is done by the drive, not the
operating system. The only difference between platforms is the file
system layout, which is created when partitioning, not when formatting.

Hi again,

If I run it on plain TOS, no environment variables set, it runs dog slow or not at all.

In MiNT, with the following settings, it is really fast:
SDL_VIDEODRIVER = xbios
SDL_EVENTDRIVER = ikbd
SDL_AUDIODRIVER = mint_dma8 (none of the other drivers seems to work on my setup)

Machine: FreeMiNT/Xaaes (latest alpha), CT60@100Mhz/25Mhz bus, NVDI 5.

The sound is heavily distorted, and it only works in 16bpp. In 8bpp, the palette is totally screwed up - but that's a problem with my setup rather than doom. Would be nice to try it in 8bpp though :-)

Thanks, thanks, and thanks again Patrice!

"tar" came from UNIX, where it meant "tape archive". UNIX also has
```

a utility called "ar" for "archive". This was mainly used to create
libaries of binaries to link with programs. So the name "tar" is
an off-shoot of the name "ar".

Just wondering, the convention at one time was that low-level formatting
SCSI drives was okay but big no-no for IDE stuff. Is that still the way it
is?

Thanks!

I would just add u can only use one step method (adding "z" to tar comandline) in mint/unix shells, maybe also in mupfell shell in TOS. So if u use magic u must tar and pack/depack separately.. Also u will proly run on gzip only so 'gzip blah' will make blah.gz. To depack u just use -d flag: 'gzip -d blah.gz' will depack it. Note, that in unix command has no endings, so gzip in unix, equals gzip.ttp in tos/magic.. For gzip/tar u may ask any MiNT user, cause command line programs in MiNT works happily as .ttp in TOS..

> is?

It is OK for SCSI drives, but does not result in anything useful if the

drive has no bad sectors. Formatting in order to use a PC/Mac/Unix or whatever driver with the Atari takes time but does not have any benefit.
Partitioning is all that is needed.
As far as IDE drives are concerned only very old drives may be damaged when formatting them. But as far as I know this has not been an issue anymore with drives that are not older than 5 years or so.

Well I have low level formatted several of them without any problem. But
  in general the JAZ stuff was not very reliable. Even without
formatting many cartridges get broken easily, start to make noises etc.

I'll keep my eye out.

Actually the Falcon is not in too bad a state, just need to get my
hands on a MagiC manual and dust off my Atari skills which have not
been used in 10 years and then only on a 520STFM.

The TT however is in a bit of a state and does need wiping and
reloading. Are there any alternatives to MagiC?

Thanks
Dave.

> backup Mint for us!

Ahem.. Whats wrong with tar? You tar your MiNT partition and thus save all
flags and symbolic links, etc? All u need is to add mke2fs and tar to your
rescue floppy. On CD u may even put small MiNT XaAES/NAES setup (kernel, aes,
desktop and tools like toswin2, mke2fs and tar (rename those to .TTP) and
that is all. Basicaly, u may duplicate your C: MiNT files. Its even possible
sqeeze that on a floppy :) If u wana boot MiNT from CD then, just edit
mint.cnf to suit your CD rom drive..

If panic strikes you just boot from CD (or copy files to C:, boot) in MiNT,
mke2fs new mint partition and untar MiNT backup there. Easy, and safe backup.

Also, most MiNT "problems" are actualy TOS filesystem problems, where C:
drive get corrupted and so mingle mint.cnf etc.. So simple backup of mint
kernel and mint.cnf + few drivers is usualy enough... and just copying that
back to C: solve issues

More dangerous problems are when some app destroy mint partition bootsector,
but even that is usualy user error :) Full MiNT backup is wise then :) and i
thin tar is best option...

Yeah, you can use MiNT.
try these sites:

Freemint for the installation:
http://atari.st-katharina-apotheke.de/home.php?
lang=en&headline=EasyMiNT&texte=easymint

Sparemint for the updates to the latest kernels and packages:
http://sparemint.atariforge.net/sparemint/

Coda.

Come come!!, you must never tell the customers that anything ever went
wrong not even once, not even a misplaced bit.

Just where would we be if companies ever had to experience a learning
curve, or heaven forbid, a development schedule which doesn't go
entirely to plan.  ;-)

Hi,

Anyone know if there is an online version of a TT user guide? I'm
specifically looking for info on which HD program (format / partition)
I need to use.

Is the the best forum for responses? Like I siad in a previous post
it's been 10 years since I've used an Atari and things have changed
quite a bit - I've a lot of questions :-)

One further question and I know there will be no simple response... Is
it possible to put a TT or Falcon on a home network (router) and get
access to the www?

Thanks in advance

Dave.

http://europeshareware.free.fr/scripts/visu1.php?Langue=n_a&editeur=1
It's on the ASH page.

But I suggest going with EASYMiNT.. Magic is $195 USD

There is nothing at all wrong with tar. As long as you remember the -f, it works admirably well, if you have room for the tar file and the iso file needed to put the tar file onto a CD. And room for the tar file and its untarred self. I do. But if all goes well, it would be one extra step, although a very stable and well supported step.

If there is a next time, I will try tar. Cannot hurt, may turn out to be faster and easier.

Thanks for the reminder.

Jim

: Ahem.. Whats wrong with tar? You tar your MiNT partition and thus save all
: flags and symbolic links, etc? All u need is to add mke2fs and tar to your
: rescue floppy. On CD u may even put small MiNT XaAES/NAES setup (kernel, aes,
: desktop and tools like toswin2, mke2fs and tar (rename those to .TTP) and
: that is all. Basicaly, u may duplicate your C: MiNT files. Its even possible
: sqeeze that on a floppy :) If u wana boot MiNT from CD then, just edit
: mint.cnf to suit your CD rom drive..

: If panic strikes you just boot from CD (or copy files to C:, boot) in MiNT,
: mke2fs new mint partition and untar MiNT backup there. Easy, and safe backup.

: Also, most MiNT "problems" are actualy TOS filesystem problems, where C:
: drive get corrupted and so mingle mint.cnf etc.. So simple backup of mint
: kernel and mint.cnf + few drivers is usualy enough... and just copying that
: back to C: solve issues

: More dangerous problems are when some app destroy mint partition bootsector,
: but even that is usualy user error :) Full MiNT backup is wise then :) and i
: thin tar is best option...

:   Janez

No, yes, yes, and yes. The devil is in the details.

Buy HHDriver. There is no better HD program.

The easiest ethernet card fits the cartridge port, and is sold on E-Bay
for the same price as direct. There are others, and more expensive, but
some people reading this list have used the Ethernec for your purpose.

Jim

Hallo,

ich habe seit einigen Jahren einen Atari 1040 und dazu die
Sequenzersoftware Cubase (3.01) (Original mit Dongle, ...). Nachdem ich
den Rechner nun einige Jahre nicht benutzt habe, wollte ich die
Software wieder nutzen. An sich geht auch alles (Disketteninhalt
ansehen, Programme starten) aber Cubase startet zwar und baut den
=FCblichen Bildschirm auf, bleibt aber offenbar ganz kurz vor Schluss
haengen (Cursor ist eine Biene).
Was koennte das sein ? Probleme mit zu alter Diskette ? Probleme mit
altem Dongle ? Probleme mit altem Atari ?

Fuer einen Hinweis waere ich dankbar

Gruss
Klaus

Hi,

Try to duplicate your original disks to check if the data on your
original disks is damaged or not.
Are other applications working?

Hi,
Thanks for all the Nos & yesses :-)

Any idea what what the cartridge port ethernet option is called? A
search of Ebay returns no hits.

Cheers
     David

The ethernet cartdridge is called Ethernec. A quick search on this
group will turn up tons of hits. A guy called Rory McMahon (sp?) is now
making them. He does tend to put them on ebay. If you need Ethernet
capability now then I recommend this route.
If you have a Falcon and/or TT and you want Ethernet AND USB, then you
may want to wait for the CTLink. However, If you've got tons of cash I
would recommend putting your name down for a CT60 accelerator, and buy
an EtherNAT from Nature.
CT60 and CTLink = http://www.czuba-tech.com
EtherNAT = http://nature.atari.org

The EtherNAT is ready to go into production now, the CTLink is ~3-6
months behind.

Coda.

Hi Klaus!

Try to clean the contacts of your Dongle! With a Kontakt-Spray or a
MOS2-Oil.

There is also a german newsgroup for ST/TT.

Best Regards,

Daniel Mandic

Hi all,

Can anyone tell me how to remove Thing desktop from a Falcon? I
renamed the Thing109 folder to ThingXXX and now whatever set I use in
X-Boot I still get errors about Thing not being found. I guess this
is more of an X-Boot question really.

Thanks in advance

Dave.

Only two enabled program; XBOOT.PRG & TOS4_FIC.PRG

Two folders:
Assign
assign.old
assign.sys
telnet.sys

NEWDESK
Lots of .INF files two being THING256.INF & THING16.INF

Do these need to go?

Dave.

Hmm, why u need room for both? U can create normal data cd, and put needed files: auto folder, mint folder, aes, desktop, mke2fs and tar. And the x.tar itself of course :) U may even edit mint.cnf and aes.cnf and u get bootable cd. Or leave all settings done for C:.. If C: drive gets corrupted u fix it and copy MiNT files back. If MiNT partiton also get corruopted, u then boot to MiNT, make ext2 partition and untar MiNT archive to newly created partiton. So its wise to add cdrom drivers etc as well to rescue cd :)

Janez

P.S: yes, it is additional step, but it does preserve links and stuff..

Yes I've heard that from a few people and the author has also been a
helpfull.  I hope it's also worth every penny ;-)

I've removed all reference to Thing from the default set in Xboot and
it still complains. The default set is very minimal with only the
following selected:

PRGs
===
XBOOT
MAGXBOOT
NVDI
TOS4_FIX

CPXs
===
General
MAGXCONF
NVDICONF
TRASH

No ACCs are selected.

Dave.

Have you checked whether Thing has been selected as Autostart application? I don't know the name of the menu item/option for the English version of TOS, but you can configure an Autostart application somewhere in the standard GEM desktop.
In order to change this you must first prevent Thing from being booted, so that you can change the setting in the standard desktop.

As an alternative, load your C:\NEWDESK.INF file and remove any line where 'THING' appears. Or (maybe the simplest solution for you) just delete NEWDESK.INF. You can create a new one any time with your own settings.

Don't let him fool you Dave, he's helped me in the past, as well as many
others. His bark is worse than his byte... <big grin>

If you do want more specific MINT related questions, you might consider
joining their mailing list, and ask questions there.

I tried to register GrafTool under the address given in
accompanying text, but my email was bounced with:

```
   ----- The following addresses had permanent fatal errors -----
Joergen_von_Bargen@hh.maus.de
    (reason: 550 Host unknown)

   ----- Transcript of session follows -----
550 5.1.2 Joergen_von_Bargen@hh.maus.de... Host unknown
(Name server: hh.maus.de: host not found)
```

Does anyone have an alternative address for him please? Apart from
registering, I would also like GFTHYP05.LZH the Online help file
for GrafTool to be mailed to me by someone if possible (I don't
have ftp/www access at present).

Regards, /Peter/

Hello,

Following the release of SDL 1.2.9 this week-end on various systems (http://www.libsdl.org), here is the Atari version, for people wanting to develop programs for various platforms. You can download it from my website (yep, I know, still no RPM version).

First, I whould thank all people that help me fixing bugs and doing tests on their systems.

- Better detection of system to enable/disable various drivers.
- Timer layer: release CPU when waiting under MiNT.
- Gem video driver: huge number of bugfixes.
- IKBD keyboard/mouse/joystick driver: many bugfixes.
- MCSN audio driver: uses a thread under MiNT.
- Xbios video driver:
  support for Screenblaster 3, Blowup and Centscreen on Falcon.
  many bugfixes.
- Xbios audio driver:
  support for FDI interface: both clocks and external output.
  uses a thread under MiNT.

That sounds like an idea, have you got the address?

Are any of these replacemnt desktops better/worse when used in a
networked environment?

Thanks
Dave.

Most new HP Monochrome Laser printers with a parallel port can either be
emulated with the old Laserjet II or Laserjet 4 driver.

Thanks
David

I do not see a problem with the Epson Stylus C-60. The Cannon has a good chance, but I am not 100% sure here...

I have already done that Joe. Some time ago infact. Roger said he was in the
process of doing it. I do not know just how far along he is though.

Yes, that is how I backed up my Mint System. I put together a lot of tar.gz files. Worked fine, but I would rather have something like CDISO or CDBackup do it.

Have you tried sending or receiving email or maybe using Cab to get to the
internet. Just wondering if you have that kind of access.

Did you check all the settings in STING? I would think that may have to do with your problem. What modules do you have in the STING folder?

The hamburg-maus-bbs, to which the E-Mail-Adress refers, has closed down in 2001. I have not heard or read anything of him the last five years or more. I�m afraid, he doesn�t support Graftool anymore, but I don�t know.

I did find a telefon-number in the directory of Hamburg. I don�t know for sure, if it is the right one, but I suppose it is. If You are interested, to try it, send me an E-Mail.

Karsten

You are looking for an Eiffel.  These are occasionally made by others
for sale, or you can make one yourself.

Reporting back. According to Hypercopy, it sets Add Headers to Yes, which does not read on a Dell box, and Discus sets it to No, and that does read on a Dell box.

What is Add Headers for?

It seems I need Discus for many things, and Hypercopy to tell me what is wrong with a disk format. Still no word from the author about registration.

Several of the more expensive HP and Brother Laser printers have PCL6 or PCL5e emulation. PCL5e will certainly work with an Atari.

Here's information on an new retro magazine you all may be interested in:

The Digital Alternative is an interactive magazine presented on two professionally produced CD-ROMS covering retro / alternative computing and gaming at its best. Each issues, supplied on 2 CD-ROMS, will have over 4 hours of video footage and over 200 pages of articles covering all aspects of retro and alternative gaming/computing.

The retro aspect of the magazine coves home computers and consoles from the 1970's, 80's and early 90's which basically means every retro format you can think of. There will also be alternative content, meaning contents about the CPC-NG, Commodore One etc.

The cost will be 5 Euro (US DOLLARS: $6.10 or STERLING: �3.40) plus the cost of postage and packaging.

We are ready to produce the launch issue but first we need the number of CD-ROMS and Inserts to produce. So if you're interested then register your interest at http://www.digi-alt.net If interested it's important to register your interest as not to under/over produce the CD-ROMs. We plan on finding the number of people interested (by registering their interest), add 10 percent, round it off and produce the result.

You can go to the main site http://www.digi-alt.net to find out more information on the contents of the first issue.

Regards,
John

Let's not forget what the route means:

This is from memory, but I believe I'm correct:

First set: What addresses may be reached
Second set: Masking (0 = strip, 255 = keep)
Third set: What port to use
Fourth set: What gateway computer (router) to find

Thus, 192.168.0.104 255.255.255.0 Ethernet 0.0.0.0
would mean to send any data intended for 192.168.0.xxx out the Ethernet port and to use any available computer as the gateway. (So why did you write the .104?)

Then 0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
would mean to send any other data out the Ethernet port to the computer 192.168.0.1 (your router). Since you intend to send all data out your Ethernet port, I think that you just need the default (last line), although you might also try:

```
192.168.0.0  255.255.255.0  EtherNet 192.168.0.1
0.0.0.0  0.0.0.0  EtherNet  0.0.0.0
```

One important point -- there are no spaces in this file! What appear to be spaces MUST be [TAB]s.

I can't guarantee that this will work, but it's my best shot at the moment.

The latest version is 8.16. For registered users updates from 8.1x are free (please email me and provide your serial number), but I would appreciate if I get only emails from those that actually have a need for the latest changes ;-). This is the list of changes since 8.13:

- Added the SYNCHRONIZE CACHE command to the SCSI-3 emulation for IDE drives. (8.14)
- Fixed bug relevant when accessing byte-swapped drives. (8.15)

```
- The partition information can be saved to the clipboard. (8.15)
- Improved support for IDE CompactFlash adapters. (8.16)

Using the GEM video driver by any chance? That might perhaps
explain the slow performance?

Finally go around to rebooting my Mega ST...do that about once every
couple of months whether it needs it or not (Windoze users quit drooling!)
and yep, sure enough it said, "8.15"... :-)

Hi,

I've just get a Mega Ste, unfortunately, it seems to be dead, because of our great postal services.......

http://perso.wanadoo.fr/jerome.vernet/specs/atari.htm

It was working before sending...

After little work (!) to make it more presentable, it won't boot...

When power on, fan and hard drive spin, but no front LED, nothing on the monitor (just a little 'crack' from the SM124 speaker).

I've checked internal connexion, seems to be ok.

Any idea, help ?

Looks like two different possibilities. 1 being one rail of the power supply is damaged but not the other. Like the 5V rail but the 12V rail is okay. Additionally, the power supplies in these things have 4 metal legs. They sit in these grooves. If proper screws aren't in and even if they are, the legs can pop out of these grooves. Since the psu section of your case is... well.. smashed, it's completely reasonable to assume that the leg popped out and is shorting all kinds of stuff. You should not have powered this machine on without a detailed inspection. It could be too late now. Though if you were going for insurance money, your course of action was probably best.

Thanks,
Mark

Yes, that right, some legs (the left one) pop out - no screw at all....
But doesn't seems to make shorting. I didn't put a screw, as it's for
groun dpurpose and the two others are in place. I will check that.

The main board is powered by +5V, I suppose. I will check the power
unit, I've just found the pinout on the net.

Thanks.

```

Okay, I've got the EtherNEC installed. I installed version 1.26 of STing.
I have the following files setup in on my C drive:

```
AUTO  - STING.PRG and STING.INF
CPX   - STINGPORT.CPX and STING.CPX
STING - ENEC.MIF and ENEC.STX
```

I went into the STINGPORT CPX and followed the instructions from these 2 places:

http://www.dwade.freeserve.co.uk/atari/main.html
http://hardware.atari.org/sfl/index.htm

My ROUTE.TAB file looks like this:

```
#
#  This is the routing table, to be used by the router to route IP datagrams
#
#  Format of routes comprises four entries, separated by TABs :
#    - First the network (subnet number) which can be reached by using this
#       route.
#    - Next the subnet mask associated with that network.
#    - Then the port name follows. This is the name as listed by ConfSTinG or
#       STNGPORT.CPX.
#    - Last entry is the IP address of a host on the attached network that
#       can act as a gateway.
#
#  The network specified can be directly attached to the specified port, in
#  that case no gateway is needed, as the datagram can be routed directly.
#  For a route to a network that is directly attached therefore the gateway
#  entry should be set to 0.0.0.0.
#
#  For an attached Ethernet the gateway entry specifies the gateway out of
#  the Ethernet, for a serial line it is simply the host at the other end.
#
#  It is advisable to finish the table by a default route. This route is most
#  easily obtained by specifying a network 0.0.0.0 with a netmask 0.0.0.0.
#
#  Routes with invalid addresses or absent ports are ignored.
#
# 192.68.0.0       255.255.255.240        Modem 1       192.68.0.1
# 130.75.75.0      255.255.255.128        Ser.2/LAN 0.0.0.0
# 0.0.0.0     0.0.0.0            Ser.2/LAN 130.75.75.16
#
192.168.0.104   255.255.255.0   EtherNet    0.0.0.0
0.0.0.0 0.0.0.0 EtherNet    192.168.0.1
```

My DEFAULT.CFG file looks like this:

```
#----------------------------------------------------------------------------
# File name:  DEFAULT.CFG (for STinG)     Revision date:
     2000.07.05
#----------------------------------------------------------------------------
```

```
#
# First we have settings used by STinG and its distributed CPX and STX :
# ======================================================================
# (Read STING.HYP for info on how to use them to improve performance.)
#
#  Used by the STinG kernel :
#
ALLOCMEM    = 100000
#
ACTIVATE    = TRUE
THREADING   = 10
FRAG_TTL    = 60
#
#
#  Used for ICMP protocol :
#
ICMP_GMT    = -60
ICMP_AD     = 10
ICMP_FLAG   = 0
#
#
#  Used for UDP protocol :
#
UDP_PORT    = 1024
UDP_ICMP    = 1
#
#
#  Used for TCP protocol :
#
TCP_PORT    = 1024
MSS         = 1460
RCV_WND     = 10000
DEF_RTT     = 1500
DEF_TTL     = 64
TCP_ICMP    = 1
#
#
#  Used by the DNS resolver :
#
#  Note that the first one of these three will not normally be used.
#  It will only be used when an address consisting of a single word
#  is used in a URI.  The DOMAIN value is then appended to complete
#  the URI as needed for the nameserver request packets.
#  (I still recommend using full URIs instead, to avoid confusion.)
#
DOMAIN      = sting.org
DNS_CACHE   = 64
DNS_SAVE    = TRUE
#
#
#  The three following are not really used by the kernel anymore, as the
#  dialer redefines these for each dialup, as they can vary when you have
#  more than one ISP dial script.  They should be defined here anyway,
#  with the values you normally use online, as some offline clients may
#  expect to find them, and also for use in local networking.
#
USERNAME    = darklord
HOSTNAME    = darkforce4.ky.org
FULLNAME    = Ronald J. Hall
#
#
#  The one following is also redefined by the dialer, and you only need to
#  define it here if you use a local network, so all machines in that net
#  can find the nameserver (the dialer only defines it on one machine).
#  Note that the value of NAMESERVER variables should always be a numeric
#  IP address, since another nameserver would be needed to resolve a URI.
#  You can specify more than one address, separated by ", " .
#   (eg: "NAMESERVER = 193.45.240.2, 193.45.240.4")
#
NAMESERVER  = 192.168.0.1
#
#
#  Here starts the stuff used by external clients and servers :
#  ============================================================
#
# Used by the Dialer :
# --------------------
#
#  The setting below is not used by the dialer itself, but by any other
#  client in a local network that wishes to contact the dialer which is
#  resident on a machine equipped with a modem. (By UDP command packets.)
#  If you have no local network, leave it as it is, since that is an IP
#  address reserved for the local machine.
#
DIALER      = 127.0.0.1
#
#
#  The setting below is used by the dialer, but only if you have chosen
#  to activate the DIAL.SCR setting to use a dialup batch file. The path
#  specified below will then be used to find the batch file.
#
LOGIN_BATCH = C:\DIALER\LOGIN.BAT
#
#
# Used by mailers :
# -----------------
#
EMAIL       = dark_lord@charter.net
SMTP_HOST   = smtp.charter.net
MAILER      = mymail
#
POP_HOST    = pop.charter.net
POP_USERNAME= dark_lord
POP_PASSWORD= tenchi13
#
#
```

```
# Used by TIME and DAYTIME clients and servers:
# ---------------------------------------------
# (Values used by me, in Sweden in the year 2000.)
#
TIME_ZONE   = +60
TIME_SUMMER = 03.26.10.29
TIME_SERVER = time.demon.co.uk
#
#
# Used by MIDI_EMU server (for some netgames) :
# ---------------------------------------------
#
MIDI_EMU_OUT = next_IP_in_emulated_Midi_ring
#
#
# Add more here as/when needed by other clients and servers
# that you install in your system.  (Read their docs...)
#
#----------------------------------------------------------------------------
# End of file:     DEFAULT.CFG
#----------------------------------------------------------------------------
```

I set the values in the STINGPORT.CPX module, saved to C, and rebooted. All comes up with no errors. The MAC address shows up in the CPX. I can use the ping program to ping the localhost at 127.0.0.1, and from the ST I can ping 192.168.0.104. I can't ping out to anything else on the network though, nor can any machine on the network ping -in- to 192.168.0.104.

Keep in mind that this is the LAN address I use for my BBS, so the hardware router 'n stuff is correctly setup for 192.168.0.104. With the Lantronix device in place, I can ping 192.168.0.104 from any other comp on the LAN. All my comps point to the routers default gateway address of 192.168.0.1, so I dunno.

Anyone have any ideas?

Thanks much!

> I have the following files setup in on my C drive:

Hello Ron,

```
>
> My ROUTE.TAB file looks like this:
>
> #
> 192.168.0.104   255.255.255.0   EtherNet    0.0.0.0
> 0.0.0.0 0.0.0.0 EtherNet    192.168.0.1
```

Er... someone correct me if I'm wrong, but it'd rather have to look
like this :

```
192.168.0.0 255.255.255.0 EtherNet 0.0.0.0
0.0.0.0 0.0.0.0 EtherNet 192.168.0.1
```

Assumed that your gateway should be 192.168.0.1, else replace by the
value it is set to.

I don't think it should make any difference, because only the first three
bytes should be compared.
However perhaps you should correct. Also have you run the HE-xxx.tos test
programs first to check everything is ok?

Well, I can't speak for the 100MHz and 90MHz CT60's (not lucky enough to afford getting another 68060, once R. Czuba found some). However, I can say that on my 66MHz CT60 with 25MHz bus, PMDOOM 0.45 is also extremely slow. Where the older versions (say around 0.27 or older?) ran incredibly smoothly (I'd say at least 15fps), I get just about 4 or 5 frames per second now. This is both with and without the GEM windowing, and running on both Magic 6, TOS, and the latest Mint version.

Hi

Looking to get a CT60 up and running and need a replacement 68060 (with FPU & MMU). Anything considered.

Cheers

```
Ian.

That's quite handy to know, that externals do work. One thing I did note was that different manufacturers wire them up juuussst slightly differently. It was originally thought that all GND's / odd pins on the FDD connector were common. I noticed that some drives would work in some enclosures but not others so laid them all out bare on the living-room floor and multimeter'd the lot.

Hi again,

Just adding here as have been away for a few days, well, been perfecting
this PS2 mouse code for the ST as have a deadline on that.

I AM going to photograph the MSTE motherboard here, likely on Sunday so
will post with a link next. It'll all be part of the write-up I
eventually do on this one.

Just guessing that it's going to be an early motherboard since it had
TOS 2.05 on it originally...

Aly :-)

Hello,

Chris and I have been madly working on this so have been a bit quiet lately. Development has gone well and is 99% complete, the other 1% being that Chris hasn't managed to break it yet and procedures have gone through several revamps.

The code is ultra ultra robust. (visions of buying various computer add-ons with quickly hacked drivers etc. We don't want that at all, as creates problems for you, and ultimately a bad reputation for us if trying to sell it, also we're going to be using the thing too...)

Below is the .txt accompanying the latest release of source code. Happy reading... :-)

Oh, PEST, as we came up with (doesn't everything have a quirky name...) is the anocrym for (P)s2 (E)numerator for the atari (S) (T).

Quite happy with the mouse disconnection/able to change mice capability too, as the PS2 standard and Microsoft states that it's not officially supported, creates all sorts of problems... Repeatedly try it on your PC with it powered up..., upsets USB mice too, and PDA's... Mostly related to current in-rush surges upsetting the electronic MCU's, or that's the official line from IBM.

"

Notes to accompany pest_027.

Intended additions to this version.

;no major code additions or modifications intended. full functionality has been achieved.
;
;final code refining will occur.

Product features (nearing very final release).

1. Enables any PS2 mouse to be used with the Atari ST bus mouse standard
2. Scaling modes are selectable to change the speed of the mouse
3. Current scaling mode is retained after power is removed
4. Setup-mode only hides button presses from the live Atari ST
5. Setup-mode allows full mouse movement thus allowing speed previews
6. Disconnection and connection of the PS2 mouse is possible
7. Mice may be changed while power is on
8. Mouse errors and syncronisation issues are fully recoverable
9. Compatiable with ALL designs of kvm switchboxes
10. Heavily tested and robust code, repeatedly and randomly attacked

Procedure for changing the mouse speed.

1. Both mouse buttons must be held continuously for 5 seconds (time not finalised)
2. (a virtual box will be drawn on screen to identify mode-entered)
3. Both mouse buttons must be fully released prior to further processing
4. Pressing the left mouse button will select the next scaling mode
5. (a virtual line will be drawn on screen, details follow:)
 :mode 1 = line drawn right
 :mode 2 = line drawn right, and then left
 :mode 3 = line drawn right, left, then right
 :mode 4 = line drawn right, left, right, and finally left
6. Both mouse buttons must be pressed once to begin exiting setup-mode
7. (a virtual box will be drawn on screen to identify mode-being-exited)
8. Both mouse buttons must be fully released before real button control is restored

Mouse disconnection routines.

;the code for successfully identifying a mouse disconnection is complete.
;
;this is broadly achieved by the following process:

After startup...
1. timer0 is initialised to countdown approximately 2 seconds

```
2. Host waits for device to bring clock low in preparation for new
movements
3. If device times out, then request a status report from the device
4. If status report identifies that reporting is disabled, then reset
the chip
5. If status report identifies that reporting is enabled or no timeout
was detected
 while requesting the report, restore processing and wait for further
input packets
  (normal process, 1. begins again...)
6. If a further timeout occurs during status reporting, then reset the
chip

;it has been found thus far that the above method is reliable and does
not impact
; on any normal flow of processing.
;

Quickly disconnecting the mouse and reconnecting.
=================================================
;this is documented here as it was found to be an issue.
;
;in the previous version of code, the device was simply polled for a
response to
; a command.
;
;timeouts take 2 seconds to run their course.
;
;if the device was reconnected within this 2 seconds, it would still
reply to the
; poll as any ps2 device immiediately would after power on.
;
;the wrong command was chosen to poll the mouse.  a command was needed
which would
; identify the mouse as not reflecting the specific initialisation
process performed
; during normal chip startup.
;
;the status report (0E9h) command was deemed to be appropriate, testing
bit 0x05 to
; determine if stream reporting had been enabled.  this would only be
the case if
; the device had gone through our own initialisation process.
;
;the chip code now correctly detects when the mouse has been
disconnected.  this has
; been found to be stable and reliable.

"

No, thats what My wife calls it. How many bloody Atari's do you need she says? Answer - All of them;-). And I like to have 2, for the Ark. One to keep pristine, and one to tinker with. Tho most have had some work done, caps etc;-).

Awwwwwwwww :-(

((((((((((((hugs))))))))))))

Completely and utterly dismantle it. Power the mothboard while out of the case to do your diagnosis. Press all of the chips in. Also, plonk the plastic case into a hot-hot bath for a few hours to get the plastic maluable again, the metal can be straightened out. Toothpaste and a nail brush/tooth brush work wonders... Those keys should hopefully press back in... just removing some of mine... mmm, see what you mean, the plastic stumps have broken off of the bottom of some of the keys.. Use 24hour araldite glue as seems less brittle than the rapid stuff..

Really feel for you, I can imagine how upset you must be after the anticipation of getting it. Had an STE turn up like that from eBay, although I suspect the seller had under-exagerated it's rubbish condition,
http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=38597&item=8195234732 Actually, there was ALOT of damage to the casing, and it was very horrible yellow. The one in the picture I don't think is the one I had...

You'll get it to work. :-)

Aly

Packaging looks a bit rubbish...  No way would you need a box that big
for a MSTE...

Why but you do need them tell your wife. It's either those or Windows
PC's, and they come with added stress too. So, you'd be obsessed, and
really moody too. ;-) Not what missey wants. :-)

Have you contacted Rodolphe? I believe he had one for auction up on Ebay.

My wife posed a theoretical question to me the other day; "if I said me or
your Atari(s), one of us had to go, what would happen?"... I gave her a
big sloppy kiss/hug, cheezy grin, and told her she knew the answer to that
question already. Satisfied, she went out of the room...looking back over
her shoulder...and again....and again.... :-)

Mike, I've not had a chance to try it yet, but didn't somebody say
something about renaming the actual program file (to .PRG?) and it ran
much faster? Just a thought...

Do both of your cards work now? (I am referring to the email you sent
me.) IF they do, what was the initial problem?

I think possibly it is your ROUTE.TAB file. I had problems until I got it straight. You MUST make sure you do not change the spaces between values. Here is your Route.tab:

```
#  Routes with invalid addresses or absent ports are ignored.
#
# 192.68.0.0       255.255.255.240        Modem 1       192.68.0.1
# 130.75.75.0      255.255.255.128        Ser.2/LAN 0.0.0.0
# 0.0.0.0     0.0.0.0           Ser.2/LAN 130.75.75.16
#
192.168.0.104   255.255.255.0   EtherNet    0.0.0.0
0.0.0.0 0.0.0.0 EtherNet    192.168.0.1
```

And here is mine:

```
#  For an attached Ethernet the gateway entry specifies the gateway out of #
the Ethernet, for a serial line it is simply the host at the other end.
#
#  It is advisable to finish the table by a default route. This route is most
#  easily obtained by specifying a network 0.0.0.0 with a netmask 0.0.0.0.
#
#  Routes with invalid addresses or absent ports are ignored.
#
0.0.0.0       0.0.0.0       EtherNet      192.168.1.1
#192.168.1.201    255.255.255.0     EtherNet 192.168.1.1
#
192.168.1.1   255.255.255.0      EtherNet      0.0.0.0
```

See the difference.

It is the only thing I can see that is way difference from my setup. I use Sting 1.25 on a STe.

It is possible if you can find a printer that uses the same printer port and
if you have NVDI 5. The exact printer may not be lised in the NVDI printer
driver list, but you could try a similar one and it may work. My wife has a HP
laser printer that she uses on her PC. That particular printer is not listed
in NVDI's list of driver, so I starting choosing some HP laser printer drivers
and testing them until I found one that worked.

```

Hello Jim,

I may have done something wrong when I tried to back up my Mint partition using CD Back/CDISO. It did the backup fine, but the binaries on the CD were not executable, but plain files. Now that I now it works, I must have not set the program correctly. So I will try it again. Thanks for the information.

Yes, I've copied/saved your file, and will try to work with it a little
bit later (time as always!).

Thanks Edward.

No, but I will once I get a chance. Thanks!

In the Cambridge UK area, or closer towards Ipswich, Suffolk??

If I may borrow your Amiga, RGB Scart cable, and Amiga mouse for a few weeks you'll get a PS2 mouse to Amiga interface in return. (with the original Amiga kit naturally).

Need to do some testing on this PS2 mouse thing we've done. The code is in place for Amiga operation but hasn't been tested, so therefore is currently disabled.

Ta,

Aly

Hi,

Can anyone tell me if either of these products are still available? I
just bought a Falcon030 & a TT 030 on Ebay, both need formattting an
resinstalling but I don't have the disks. The software is licensed to
the guy I just bought the machines from.

Dave

Version 3.62 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix update. Some con-critical bugs were noticed only after the release of V3.61, and they have now been fixed.

See the history file and the hypertext manual for more information.

Have fun.

We need to break this down into smaller details.

To write a CD, select MiNT and Unix compatibility, which will get permissions and flags set properly. For me, with a 32 MhZ TT, I need to boot MiNT into single TOS to reliably write a CD, and I can do 4x. Otherwise, 1x is iffy.

If you did that, keep that CD. The difference is in getting the files moved back.

The last time I did this, I used two separate methods to move files back. And that missed two things, which I needed to fix. Teradesk does not balk at long file names far down in the directory structure, which is nice.

Copy everything with the latest version of Teradesk you can find. Then, if needed, re-copy bin, sbin, usr sbin and usr bin, and X11, which I think is in etc. That may still miss wtmp, which is in /var and both copies need to be writable.

For copying the binaries, I used Thing, which is my regular desktop. This second step takes very little additional time.

Oh, the other thing? N_aes writes a copy of itself in bin, I think, and does not set the program flag. My MiNT configuration file seems to look there first, and will not look further because the name matches. I have set that thing to binary executable several times.

I know nuttin about the latest version of Xaaes and its file selector, and what it uses for copy routines. Have heard good words, have not used it myself. That should handle copying permissions and flags OK.

The bottom line is that you may need to copy your binaries separately, and may miss one or two things that need to be either writable or executable.

Jim

Sounds to me like we should encourage Anodyne to write a script to backup Mint for us!

```

I've not had a chance to try any software to actually access the 'Net yet, like CAB/Highwire, ftp programs, Newsie, mymail or whatever...but, using the above in my route.tab file, I was able to ping the other computers on my LAN and other comps on my LAN could ping this comp at 192.168.0.104.

Thats the good news.

The bad news (so far) is that when I try to telnet into that comps ip address (192.168.0.104), the connection is refused. This is with my BBS software up and running, which works fine with the Lantronix device.

Anyone have any ideas how I can make my BBS software recognize the "incomings" from the STing/cartridge port combo?

Thanks much.

Sounds like a bug in the memory management of either PureC or MiNT.
I have been using PureC with MagiC for years, without anything like this
ever happening.

I have used Pure C since it came out (1992?) exclusively with
TOS 3.06 almost every day. All those years I never had to recover a
single file that wasnt wasted by myself.

Hello :-)

<smiles> thankkyy you :-)

Ah, have got me worried now... About mb versions etc. etc. and wire links. The difficult bit would be the GAL UA02 (I think...), assuming it's a chip to be blown.

Will reply back to this again tomorrow with a complete photo of the actual MSTE motherboard. It did originally have German TOS 2.05 in it...

thx,

Aly

Hi All

Unfortunately had to delete my Newsie folders for the info on how to get
Iconnect working with Highwire. But noted down the following fix.

Somebody recommended changing the MTU setting to 1492 in IConf.

With this change, I find that clicking on my home page links brings up
messages like "no route to host" or "HTTP 1.1 Gateway Error" eg I
don't get to the pages.

The MTU was set at 576 - this produced the same Gateway Error message.

Somebody also recommended setting the RTC to 1492, but I can't find
anything called this in the "Profi" mode on IConf!?

Any more thoughts on the matter will be appreciated!

Regards

Neil :-)

It happened to me many times (MagiC! 6.20) before I decided to move the
log to another partition. I think (don't remember) it was due to the
boot selector I was using at the moment (X-Boot, not to mention it).
No problem anymore since I've been using Menu_6 - not to say I kept the
log file on the alternate partition however ;-)

Hi Neil,

|Unfortunately had to delete my Newsie folders for the info on how to get
|Iconnect working with Highwire. But noted down the following fix.

Did you remember to rename ICONNECT.OVL to NETWORK.OVL?

|Somebody recommended changing the MTU setting to 1492 in IConf.

|With this change, I find that clicking on my home page links brings up
|messages like "no route to host" or "HTTP 1.1 Gateway Error" eg I
|don't get to the pages.

|The MTU was set at 576 - this produced the same Gateway Error message.

|Somebody also recommended setting the RTC to 1492, but I can't find
|anything called this in the "Profi" mode on IConf!?

|Any more thoughts on the matter will be appreciated!

When you run ICONF.PRG you will see that Profi mode as a check box in
the bottom left hand corner.

Correct.

> TOS !).

#7 I think Rudolph, but it only affects the Format menu. You can also
use HD cookie, which does the same thing.

> - check and correct the GAL UA02 if it is the version #1 (you need #2). And

The TT and MegaSTE work fine with external HD disk drives, I have built
a couple and never had an issue. It could be a steprate issue, but it
sounds odd. I have even used an old SF314's fitted with a HD drive, and
it worked OK. Could be down to the external drives wiring. Are you just
using the one drive?

Yes and the file is on my web site  www.czuba-tech.com
OR you can buy the chip at BEST !

> Will reply back to this again tomorrow with a complete photo of the

So you have to erase the chips with UV and program them with 2.06

Or you can BUY too at BEST.

You need nothing about the step rate !!
No software in the auto folder...

The only problem may be the WD1772 that will not support the 16 MHz operation instead of 8 MHz.

Sure, the best is to use a AJAX chip (the Atari 16 MHz version of the old WD1772).
You can buy AJAX at BEST too.
It is expensive.

PS : the MSTE may have a AJAX, check that.
PS2 : it is rare on MSTE, but not rare on first TT030 even if they where not able to use 1.44 because of the TOS 3.01 no able to manage that.

+

Unless you really need to look at the boot log it's best to direct its
output to nul instead.

Having said that I've never had a moment's worry with the log.

As a general idea for the next time, might be worth pasting problem URLs into a Google search box and choosing to view its cached version of the pages.

Also worth using the Wayback Machine to look at its historical record of cached pages.

You know the saying, the user knows to kick it to make it work - the engineer knows where to kick it to make it work, and the designer knows why it works when you kick it :-)

> Glad you got it working, but you do know that means you will sooner or
> later need to take it apart and give the socketed chips a good reseating,
> right?

That's very true - there aren't many socketed chips, but one that might escape the unwary is under that metal lid in the middle-ish of the motherboard (video shifter).

Good advice. Thanks Derryck.

Hi NG

I have found a pleothora of original classic Atari ST Games, that some of you may be interested in:

The whole lot can be your�s for the symbolic price of 10 usd/eur (excluding shipping) or some kind of Atari music soft- or hardware depending on what you prefer!.
(If you do not like the games, you have a faboulous chance of upgrading your 720 kb disk deposit!).

I only sell the whole lot!

The Games are in Denmark, Europe.

All games come boxed with full documentation and memorabilia! Most of them have never been used.

See picture here: www.msystem.dk/images/AtariGames.jpg

Sincerely
Peter Hjorth Feddersen

Gamelist:

The Ancient Art of War in the Skies: The World War 1 Strategy & Action Game by MicroProse Simulation Software (1992)

SDI: Now the odds are even by SEGA/AcTiVision

MicroLeague Wrestling by MicroProse Simulation Software (1987)

Their Finest Hour: The battle of Brittain by Lawrence Holland - An historically accurate, action-packed air combat simulation by Lucasfilm Games (1989)

Skyfox by Ray Tobey/Electronic Arts/Ariolasoft (1984)
Skyfox II - The Cygnus Conflict by Dynamix/Electronic Arts (1987)
Terminator 2 - Judgment Day by Ocean (1991)
Corporation by Core Design Limited (1990)
The light corridor by Infogames (1990)
Pinball Dreams by Digital Illusions/21st Century Entertainment Ltd. (1991)
Cruise for a Corpse by Delphine Software (1991)
StarBlade by Simarilis (1990)
Cybercon III by U.S. Gold (1991)
Infestation by Psygnosis (1989)
Crime Does not Pay by Titus Software (1990)
Carrier Command by Rainbird Strategy Simulation (1988)

520 STe Turbo Pack :
Games Disk 1: Indiana Jones & the last crusade by Lucasfilm Ltd. (1989)
Games Disk 2: Dragons Breath by Palace Software (1990)
Games Disk 3: Blood Money by Psygnosis (1989)
Games Disk 4: Anarchy by Psygnosis (1990)
Games Disk 5: Outrun and Super Cycle by SEGA (1986)
Games Disk 6: Impossible Mission II by Epyx Inc. (1988) and Human Killing Machine by U.S. Gold Limited (1989)

-and additional titles which i cannot recall!

Sincerely
Peter Hjorth Feddersen, DK

Hello,

With the (maybe soon) upcoming CTPCI expansion board for CT60, I think it is necessary for future buyers to know which PCI cards they could use, provided a driver exists.

So, if you have an Hades, or a Milan, or an Eclipse on your Falcon, I would like you to send me all the info you got about the PCI card you use (i.e. configuration bytes, product name, url of Atari driver).

You can use this program to read the PCI configuration bytes of your cards (you can send me a screenshot for each card):
http://perso.wanadoo.fr/daroou/productions.htm#PCI_INFO

I will make a page on my website with all the infos collected.

Hi there,

I tried v0.45 yesterday, and it worked fine. No crashes!

However... What happened? The older versions where so much faster..
Ironically, DougQuake has 2-3 times higher FPS than pmdoom 0.45!
Even with sound off, I find it close to unplayable on a 100Mhz 060
(25Mhz bus)..

Please don't let this put you off; I really like your stuff and want to
se more of it!

regards

Pure C does tricky things with out of range filehandles for
its file caching.

I remember vaguely that emutos and/or aranym suffered problems
with this and patched Pure C.

I'll see if I can find the topic in my NG/ML archives.

The shipping would not be worth it for the one game I'm interested in
(and don't already have), but for you Europeans please note that
Ancient Art of War in the Skies, Their Finest Hour, Cruise for a
Corpse, and Carrier Command are all excellent games and well worth
trying on the ST.

Galen

I guess. Have you put the information from the CD's onto the hard drive and
have everything go ok?

Not sure, but I do not think so. I do use Magic as an OS, but I do not use it
at all when I boot up Magic. The Mint.CNF file does get messed until I try and
boot up MintNet.

Where is the log file usually located and what is the name of the file. Maybe
it did screw me up. Does this mean I need to overwrite my exiting Mint.prg
with a fresh new file? Sounds like it.

hi,

your are talking about one of my post
(this one in fact)
http://groups.google.fr/group/comp.sys.atari.st/msg/b5d70241e62132f3?dmode=source

this is a answer for a french user thats why I say rtc (french name for a
normal
phone line no dsl), thats why you dont find this option on iconf, they don't
exist ;-)
1492 is for the MTU.

Did you ever get the Ethernet card to work? How much are you selling it for?

I tried to write you on this two weeks ago, but ah well.

I have a TT030 I might want to try this in.

Looking for an adapter to allow me to use a PC style keyboard (any) with an Atari ST/STe/Falcon (any or all).

I'm trying to use a KVM switch to let me use the same keyboard with an Atari and a PC. I had an adapter card previously, but seem to have misplaced it :-(

Thanks

Ian.

After fixing your capslock key, first take a look at the NVDI website. When you say "Printer" in the Atari world, sooner or later you will need NVDI. NVDI supports a lot of (old) printers. Unfortunately NVDI seems to be a dead project and there is no support for newer printers. If you buy for example a new HP printer, you have to try one of NVDI drivers for an older HP model and hope that it works.

And be sure the printer you pick has a parallel port. USB-only printers can't be used on Atari.

Most printer manufacturers still use the same protocols that they developed a long time ago, with few changes, so there is a good chance that they will work. The only problem is finding brand new printers that have parallel ports now.

>And be sure the printer you pick has a parallel port. USB-only printers can't be

used on Atari.

Yet. USB will be available for MegaSTE, TT, Falcon, Hades/Milan and
CT60 soon.

> Just a thought.

Well, its all about atari computers support, theres no more atari computers on market, the dealers shops are no more interested in these things, so its all about that we are a really SURVIVORS and it could be much more progressive to have a free access to some information gates.

Anyway by now I scanning FALCON SERVICE/DEVELOPER MANUAL so should I sell it for money?

Ok, if somebody want FALCON SERVICE MANUAL I can send PDF or print it, please tell me if you want one and what price you will pay.

I also got TT schematics so if anybody interested... Feel free to let me know you want buy it :)

Long Live Atari! That�smean new hardware, software and more users!

One small correction. My setup uses three CDs, and one is for all the rest of the usr files.

Have I put them back? Yes, three times, one drive failure and two mysterious events. For this, I would suggest the very latest version of Teradesk, which may be working for this purpose perfectly by now. It takes very big chunks of data to copy, and will run unattended. This takes a while.

Prior versions of Teradesk either missed the permission bits, or the program flag, so I wound up using something else for the four binary folders. I have not tried the latest, but the history file is encouraging. Anyway, make sure your binaries are executable, and your wtmp files are writeable.

Jim

Coda <smeg_007@hotmail.com> writes:

: >NVDI supports a lot of (old) printers. Unfortunately NVDI seems to be a dead
project and there is no support for
```

newer printers. If you buy for example a new HP printer, you have to try one of NVDI drivers for an older HP model
and hope that it works.

: Most printer manufacturers still use the same protocols that they
: developed a long time ago, with few changes, so there is a good chance
: that they will work. The only problem is finding brand new printers
: that have parallel ports now.

One of the two differences between old and new printers is that the things are stuck in graphics mode, and do not have a text or draft mode any more. If all you are doing is printing bitmaps, they work fine, if you can connect it to an Atari.

If you need text mode for anything, you need a used printer, and a fairly old one, too. I think Epson stopped supporting text with the Stylus 600.

Jim

I've bought an IDE Compact Flash adapter for my Milan, but I can't get it
to recognise any of my CF cards. I've tried to install the adapter both as
slave and master, but no difference. My oldest CF card (an old 64Mb
TwinMos card) isn't recognised by HD-Driver at all, while my newest card
(also from TwinMos, but with 512Mb) is recognised but can't be used.

With the 512Mb card both TOS and HD-Driver recognise it at boot-up, but
it's not accessable from the desktop. Hddrutil won't let me format or
partition it, it's like the card isn't there at all. If I let hddrutil
scan for devices, it reports the card as a Samsung CF-card during the
first scan, but any further scans reports it as a Megafile 20...

Both the adapter and both cards works fine on a PC running XP, so I assume
that the problem is that HD-Driver is picky about cards. I have HD-Driver
8.03, does anybody know if a more recent version will help? Also, does
anybody use CF-cards and IDE-adapters successfully?
```

My quite new HP Deskjet 3820 can print plain ASCII text just fine. It replaced my Deskjet 500 that died after 10 years of heavy use. But I must say the Deskjet 500 worked more reliable together with my Atari computers than the new 3820. The 3820 frequently goes crazy in the middle of printing a page, and then starts spitting out pages with garbage. Even after a power reset things are not always back to normal :-(

dear :coda,martin,and jim(and any other un mentioned greats)

hello thanks for reply ,.......ah so fanatic small print people i
assume,''''''sorry about capitals,just had it on for no reason.

well ,i like you guys alot.,probally because of the amount of time and
effort put forth towards the projects and all's devotion.... i fully
appreciate the content of the emails everybody contributes,
 i too really like my atari computer and wish to use it to the "full"
ability.

too be completly honest i've been somewhat following the newsgroup for atari
"movement" or current projects but have really nothing in comparison to
contribute. from the eathernet - to the usb , to the dissassemblers -to the
www.atari forums, seem to currently have alot of enhuesists.(sorry)

thanks alot for good work and maybe i can gain the ability to catch up
technically with you folk.
i program in my spare time and am gaining a clearer understanding of basic
after two years of practice.(just small sub routines!!!)
nvdi here i come!!

thank you
charles.

An update to HDDRIVER 8.1 might solve your problem. You should try the
demo version of HDDRIVER 8.1
(http://www.seimet.de/hddriver_english.html). There were several changes
related to CF adapters in the latest versions.

What is the version number of the latest HDDRIVER? Mine is 8.13. Is
there a way to upgrade it to the latest one?

I bought a 520 STE which works great (4MB, AdSpeed board etc) but the case is shattered. Anyone have a dead unit I can salvage the case off of to keep this one alive? I need the top and the bottom.

thanks

Andy

Try formatting a disc and writing to it. Something like the
desktop.inf. Swap the WD1772 over, re-insert it.

Personally, I feel that *any* Atari is worth fixing! <grin>

Seriously though, have you tried the time honored tradition of taking all connecting cables loose from the ST, raising it about 6-12 inches and dropping it on a hard surface? If you do that, and it works, its probably chip creep. The chips will "creep" out of their sockets sometimes, due to heat expansion/contraction, etc, etc,..

If it does work, then you'd probably want to disassemble the ST and check all your socketed chips, connections.

If it doesn't work I guess I'd swap out cables to see if one went bad.

Hope something here helps.

PS If you do decide to toss it out, e-mail me for my address! <smile>

http://www.fujiman.com/index.htm

Guys, has anyone been able to get through to here lately? I've been trying for about 2-3 days now and it keeps timing out.

I'm looking for the instructions on how to setup an EtherNEC with STing.

I'm curious to see if I can get it working with my BBS and thusly, a faster transfer rate than the serial port.

Thanks!

Hmmmm??? Have you tried opening up the ST and pushing down all of th chips and then trying it again? That has solved many problems for me from time to time.

I have a 1040 STE case top and bottom and am in Seattle!  It is a little
discolored but looks great and not broken at all.

Yikes, 6-12 inches? That could seriously break it. The standard is
actually 4" in the "Atari 4 inch drop" LOL!

> If it does work, then you'd probably want to disassemble the ST and check
> all your socketed chips, connections.\

Yes this would be the better option if you like your Atari!

I'm in the U.S., Ohio specifically. Sorry for that, the world seems so small now with the Internet. I imagine a UK case would work too? Maybe shipping would be prohibitive.

Hi all,

My page is http://fujiman.no-ip.com. It is hosted on my home 'puter.

I hope to have a FAQ soon for Magic, MiNT and STing soon. If you have any configuration questions or problems you can email me at rorymcmahon@nospamyahoo.com . I will try my best to help you out.

I also have ichat/yahoo messenger user bigmacmang3 and I can try to walk you through some file configuration.

If you have a FAQ or suggestions for a FAQ, let me know.

Thanks,
Rory

Hi all,

My page is http://fujiman.no-ip.com. It is hosted on my home 'puter.

I hope to have a FAQ soon for Magic, MiNT and STing soon. If you have
any configuration questions or problems you can email me at
rorymcmahon@nospamyahoo.com . I will try my best to help you out.

I also have ichat/yahoo messenger user bigmacmang3 and I can try to
walk you through some file configuration.

If you have a FAQ or suggestions for a FAQ, let me know.

Thanks,
Rory

I forgot to say, start at 2", then when that doesn't fix it, work your way
up to 12", in 4" increments. <big grin>

Glad you got it working, but you do know that means you will sooner or
later need to take it apart and give the socketed chips a good reseating,

I have some questions already. I went to the Atari hardware sight that was mentioned, where there is a small walkthrough. Keep in mind, I've not tried *anything* yet.

1. The ip address that is mentioned - is it really locked into just that one?
2. I don't have *any* Windows machines, never have, never will. I do have a Dlink hardware router. I'm assuming that I can just assign an ip address by it, to the same effect, right?

Thanks.

Here is why, you logged on as a "visitor" and never obtained a permanent user account. I need to update that script file so that if you are a visitor it ignores you. Visitors can tour the BBS, but honestly are very limited in what they can do/see. Which is as it should be.

Why not take just a couple of minutes and get a permanent account? :-)

Not really. Many items are worth more with the box intact. In some
cases, even double the value.

Cheers,
Mike T.

The box, it's value - it's all perception based. Most collectors of these kinds of items are somewhat obsessive-compulsive. They want to complete a collection, they seek to have something the other collectors do not. The reason anything has value is because someone out there wants it or it would be worthless otherwise. I don't mean that like it's a bad thing, merely that it's a reality.

Besides - that box looked like it was in pretty rough shape.

From a collecting standpoint - MHO is that an item like the B&H box is only worth something if it matched up to the computer that came with it (BH with original packing container), or if it had some historical or special value. Maybe... "B&H Apple II box, originally hand-packaged by Woz himself - has small blood stain from where Woz accidentally nicked himself with the packing tape dispenser. Proof of DNA on file, will provide Certificate of Authenticity. Clone your own personal Woz."

Ick!

My MiNT installation has gone belly up enough times for me to have
learned how to refill it quickly, but the last two times it died, I
checked something I had never checked before. My boot drive had
some lost sectors.  Used Discus, could use ICD Cleanup or Diamond
Edge or some other programs to find and fix this. The interesting
thing was that the lost sectors had the same content, log files
from two programs, and two chunks of binary.

It may be possible for a damaged boot drive to munge the MiNT
drive. If enough of the crowd of MiNT users who have to back
up and start over will be so kind as to investigate their boot
drive when MiNT gets damaged, someone may get to the bottom of
this yet.

BTW, CD backups work fine. Writing at 4X speed on my TT can be
done only by disabling the MiNT.CNF file and booting into single
tasking MiNT. Otherwise, I will get a disk error at exactly the
point, and make a batch of coasters.

I have dispatched more than enough funds, in Euros, to the last known address of the author of Hypercopy v.1.7, long enough to expect a registration code any day now.

I want to investigate something while nature takes its course.

Hcopy will let you investigate anything on the boot sector of a disk. The registered version will let you save a boot sector format to use in formatting more disks.

The drive on a Dell clone at work fills the boot sector with unimportant, I think, details, and the details my Atari TT and unregistered Hypercopy put there are different. I think that copying the Dell boot sector would let me format disks on my TT that will read on the Dell DOS clone.

Thus, I would like to borrow or rent a registered version of Hcopy, for some investigation that might help with several people's problems, and get the author a few more registrations.

Jim

When formatting a floppy disk with DISKUS the Dell did not accept it?
Whether a PC is manufactured by Dell or another vendor should not make
any difference, because DOS basically is DOS, regardless of the vendor.
(DR DOS or MS DOS should not matter here), and DOS is responsible for
evaluating the data on the boot sector.
If your PC does not accept floppy disks created by the TT it might be
because of floppy disk controller incompatibilities, not because of the
actual boot sector content. The Atari controller might produce something
the Dell controller cannot read.
If this is the case it is more than unlikely that any software can fix this.

Hi!
Anyone can help me on this?
My ATARI STe as no longer a valid floppy drive. So I would like to know if
it is possible adapt a new one, like a PC one on the Atari. What I need to
do? Do I need a special floppy or I can simply use a regular PC one!

HELP!!!

Thanks

Most PC drives will do in a pinch, just have to make sure it is set to
ID0. Teac have a solder link on their drives IIRC, and work quite well.

Mark

You are talking about an internal drive correct? Yes that is possible. I installed a PC TEAC drive in a 1040ST. After changing the jumpers around, the drive worked perfectly.

Same for me. I hadn't booted it up for a while and when I did I got a load of
errors. Also I noticed the Mint.Cnf file was messed. I had to copy in my
backup in order to try it again. I am going to try and get it back by using
the EasyMint installation. I just want to format my hard drive and I will copy
over my files that I had backed up onto a CD.

>BTW, CD backups work fine. Writing at 4X speed on my TT can be

>point, and make a batch of coasters.

Just how are you backing up Mint onto a CD?

Guys for the record, where is pin 1 on the cartridge port? I mean, looking

at a Falcon or Mega ST (the cartridge port is standard across the ST/TT/
and Falcon machines, right?), is pin one close to the front, or the
backplane?

Thanks.

Pin 1 is located toward the back of the computer on Top on the cart
port.
Pin 2 is on the bottom of Pin 1. Both are +5V.

Use a Multi-Meter to check the Voltage if not sure.

For Sale....

Spectre GCR Cartridge with 128K Mac Roms installed.

Includes Original Manual and a NewsLetter or 2.

Version 3 of the GCR Software. System 6.8.0 on Disk

Also, includes around 100 related Disks of Mac Software.

Cartridge is in very Good Condition. Worked fine last time I

used it on a 1040STE. Fairly Rare Item.

NOT FOR SELL IN THE UK OR GERMANY!

I may trade it to some other Atari Item I don't have.

For asking price, contact me in E-Mail.

Cartridge and etc is in the USA.

: Just how are you backing up Mint onto a CD?

: --
: Edward S. Baiz Jr.
:   (Gamer)

It takes two CDs. Usr share is one CD, everything else fits on the other. Extendos, CDISO, set for Unix and MiNT compatibility. The "name changes" work themselves out in the end, from an unadvertized file that puts them back. Nothing much to it other than not trying to record too fast, which will cause a write error at the same point on every disk.

File selector for this is Boxkite. The n_aes file selector does not seem to cooperate at selecting what to back up.

Is that an answer?

Jim

Thank you. I had forgotten that Discus formats disks, as silly
as that may sound. I will try one and report back.

You may be right, but it may also be true that whatever drives
the floppy drive may look for exact correspondence to its own
boot sector, to avoid some programming lines, and what my Atari
TT writes differs just a little in things other than tracks and
sectors. This is what I want to find out.

Jim

Uwe Seimet <Uwe.Seimet@seimet.de> writes:

Hi,

Question is, how straightforward is it if a 720k is already fitted internally?

I'd like to connect an external FDD to my MSTE running TOS 2.06. Most of my externals (5 of em) have been fitted with Sony MPF-520's, which are high density drives.

If I connect one internally then no problems, 1.44!! If external though, then grumble grumble goes the drive.

Have read up on the situation with regular ST/STE's and extra sensing lines. Can only wonder that the sensing line isn't present on an MSTE's floppy port, but then that would mean that an MSTE could only ever use an external 720k drive.

Having read a bit about the reviews on the MSTE, it says it has no way of distinguishing between a 720 and 1440.

Is written here on the bottom of page 2;
http://www.retro.dial.pipex.com/megaste/

Any ideas?

Thanks,

techie_a

1.44 MB floppy works fine on MSTE !
You have to :
- use TOS 2.06, not 2.05 that is buggy for HD...
- put Jumper #6 on ON (the HD button will appear in the FORMAT menu of the TOS !).
- check and correct the GAL UA02 if it is the version #1 (you need #2). And add a wire on the mb if it is the fist model of mb !

Ideas, not necessarily correct: for 720K, you feed a drive with
a 8khz clock, and to get 1440 you feed it with a 16khz clock.

They also need different step rate times. Perhaps you need an auto
folder program that sets the step rate for Drive B. I have one,
if that turns out to be the problem. At least I think I have one,
but have not used it for quite a while. It came with an IB 5 1/2
inch drive.

Growling drive to me suggests a step rate problem. You need to set the right one somehow.

End ideas.

Jim

Didn't know that this was a problem. I have been running MiNT on My
Falcon/Afterburner, TT and Milan060 for years now and have only had a
fatal disk crash once.

However, PureC 1.1 seems to f**k up sourcefiles when they've been
saved/overwritten several (*many*) times. Only the first sector is
correct, the rest is garbage. I've spent some hours with disk editors
recovering sources... Haven't used PureC under MagiC or TOS enough to say
if this problem is MiNT-related.

Do you happen to use MagiC with boot-logging enabled?? This messed up my
TT really good once, it overwrote mint.prg and much of the contents in
c:/mint/ with log messages.

No, sorry I don't. I think I setup Xmame under Linux one time, but never
did fool with it much after that...

If I'm wrong others will correct me, but I'd be surprised if Xmame
supports any Jaguar games. My understanding is that the Jag is hard to
emulate, although there is an emulator that I had running under Linux one
time. I never could get sound to work on it though.

I've run into a similar issue when my CT60 was installed. I'm not sure
(more tests to do), but the early indication is that it's a termination
issue.

Darn frustrating when CDISO reports no problems yet you can't read it!

The "Data on Drive P: may be damaged" error is not likely to be buffer
underrun (since the software is known to work on the ST @ 1x speed),
but it's easy enough to check -- try burning a very small CD, say 1 Mb
and see if the same error occurs.

Even if there is buffer underrun, CDISO should give an error message,
so I doubt that's the case.

Galen

Wow - I've bought from them several times and never had a problem. Always
got what I ordered. BTW, VSWMORETP is "Software and More". They used to

operate at http://members.aol.com/SWMoreTP/HOME.html but moved to eBay.

Well, thats what Edward posted. Here is what I've got:

Mega ST -> ICD Link2/plugged into an Syquest EZ135 -> out to a shoebox style case with a 4 gig Seagate HD, then internally to the CDR, then the SCSI cable comes to an external connection on the same case.

Termination:

Mega ST - beginning of chain
Link2/Syquest - not terminated
Seagate HD - not terminated
Plextor CDR - not terminated
External connection on HD case - termination block (end of chain).

That should be correct, AFAICT. HDDriver and Extendos both report all the
devices, each with separate ID numbers. The drives work fine, no data
corruption when copying files, and with a BBS and all the file activity
that goes on, you'd know it pretty darn quick. :-)

The CDR reads all disks just fine, except the ones I burn on it. All
commercial CDs are read fine, as well as any CDs that I've burnt on my
Linux comps.

No thats definitely not it. I just finished a test I was trying. I took out that older Plextor CDR and put my Falcons Plextor 12/4/32 in its place. I can report that I just successfully burnt an iso9660 CD with CDiso and its just fine. Both the Atari and my Linux box reads it just fine. So to sum it up, everything worked with swapping out the drive and burning at 2x, which is the Plextor from the Falcons minimum speed.

So now, I need to try something else. Somebody in another post in this thread mentioned that the newer media sometimes doesn't like 1x. I had not tried that with the older Plextor CDR. Since I've got the newer Plextor hooked up right now, I'm going to go ahead and back up all my data. Then I'll swap the drives back out and see if going to 2x with the older Plextor CDR and the Sony media will work.

If it works, then I guess its the media after all. If it does not work, I'm going to assume that the older Plextor will work with reading CDs but not burning any (does it have different lasers for reading and writing? Maybe just the one that burns is bad?).

I should be able to finish up later tonight and I'll post what results I get.

Thanks everyone.

Version 3.61 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix update. Soon after the release of V3.60 some errors were noticed, two of them rather serious, and they have now been fixed. Upgrade from V3.60 as soon as possible is advised. Beware that any icons created in V3.60 by dragging objects from directory windows to the desktop may have corrupt or missing object path information.

Have in mind that substantial changes were made in TeraDesk since V3.50; although the program has been tested as much as reasonable, it is possible that some newly created bugs has passed unnoticed. If you observe any anomalies, please let me know.

See the history file and the hypertext manual for more information.

Have fun.

RJH> bad?).

This really could be the point. The first burning lasers were not that
durable, so maybe it really has become too weak for producing correct
patterns on the CDR-media.

You mentioned that one burning attempt succeeded (with the backup tool) -
was that the first CDR that you burned with the old Plextor (and all the
unreadable ones produced afterwards)? This would support this assumption.

     Regards,

          Alexander

Thats exactly right, one successful burn with that particular CDR and then
none since. :-)

The Link2 doesn't support arbitration. Most CD-Rs like to see it, although if that was the problem, I would expect that you wouldn't be able to read or write to the recorder.

There's some possibility that your device chain might be too long - I don't know what the limit is for the Link2, but don't assume that it's necessarily the SCSI max (which is 6 metres). It could also be a bad cable somewhere in the chain. Or even (unlikely) a bad terminator.

>That should be correct, AFAICT. HDDriver and Extendos both report all the

>>
>> Galen
>
>Yes!

If CDISO doesn't report any problems, then the recorder isn't reporting any problems either (unless there's a pretty gross bug in the drivers which no-one else has found). If the recorder isn't reporting problems, I think it must be either a hardware failure (presumably only in the write hardware) or a termination/cable problem.

By the way, although I appreciate people wanting to solve problems without taking up my valuable :-) time, I really don't mind helping out. So please feel free to email me if you (or anyone else) has any problem

with any Anodyne Software products. Please use the email address on the
web site, I post under a Yahoo account to try to reduce spam (fat
chance).

Roger Burrows

Reading from that CDR is not a problem. Everything I've thrown at it,
besides CDs actually burnt by it, are read just fine.

All valid possibilites, but I'm fairly sure none of the above is the problem (see below).

> Are you using HDDRIVER"S SCSIDRV driver, or ExtenDOS's internal
> routines?

I'm going to make an assumption here - I recently upgraded to v8.15 of HDDriver from 7.0. I used the autoconfigure all devices option, so unless it sets the SCSIDRV to be used automatically, then I would say no, because I didn't specifically see or check that option. So I'm using ExtenDOS's internal routines, I suppose. Perhaps Uwe can let us know for sure about that.

I'm fairly sure its the hardware (see below).

I understand Roger, and thanks for replying to this thread. Most of the time, I will post/ask questions here, because I figure if it gets resolved then its available for anyone else to read as well. Perhaps it will help someone else who encounters the same problem.

Now. Here is why I don't think its anything but hardware failure on the part of the older Plextor CDR (you might have already read this in another message I posted, so apologies if you have). I took a much newer Plextor CDRW, 12/4/32, out of my Falcon and replaced the older CDR in my Mega ST setup. I made *no* other changes. Using CDIso at 2x (the min speed the newer driver will apparently do), I proceeded to backup 3-4 gigs of data on multiple CDs with -> ZERO <- coasters or errors. So AFAICT, that pretty well seems to point to the older CDR instead of termination, cable length, or CD media problems. Another user did post that he thought some of the newer CD media (I'm using Sony CDRs, if you didn't catch that ealier in the thread) had problems being burnt at 1x speed. I hadn't heard this before. So next I'm going to put the older CDR back in, and try burning at 2x with it. If it still doesn't work, then I believe its the problem. If it does work at 2x, then I guess its the media.

I'll try that out tomorrow and post the results.

Again, thanks for the reply Roger and mega thanks for continuing to
support such great software for the Atari community!!!

See ya. :-)

Whether the SCSI driver is used or not depends on a setting in the CD
writer software. The SCSI driver is always available and it depends on
the thirdy-party software whether it is used or not.

> Is my Falcon faulty ? or, do they all behave the same way ?

Before I sold my Falcon earlier this year I had a 1.2GB IDE disk
in it, and this topped out at 2.5MB/sec, but only in lower colour
modes. I once took the 1.2GB out and made a disk image of it to
use with ARAnyM in Mandrake Linux - creating the image took just 2
minutes...an average of 10.5MB/sec. Obviously the IDE controller in
the Falcon will be the limiting factor with all but the slowest and
oldest IDE disk units....

Hello Ronald,

Had big trouble with a Plextor unit, got it solved with an LG drive.
Maybe should you try with a Yamaha ?

Regards,

Jean-Luc

Okay, I wasn't sure about where that setting was. Thanks Uwe.

Okay, I've now had a chance to swap out drives. I've put the older
Plextor CDR back in, and took the newer Plextor CDRW 12/4/32 out, after
backing up all my data from the BBS.

I tried burning the Sony media at 2x with the older Plextor and had the
same result; CDiso reports a completely successful burn, but I still get
the "Data on Drive P may be damaged - Retry or Cancel" error when trying
to read the freshly burned CD. Inspecting the Sony CD after burning, it

doesn't even look like anything has been burnt to it.

I think we can pretty well conclude that while the CDR is reading any CDs not actually burnt on it just fine, its burn mechanism (laser, etc) is basically shot. Guess I'm in the market for another one, once I get the funds. :-)

I wish to thank Roger, Uwe, Galen, Phantomm Jean-Luc, Edward and anyone else who contributed to this thread. Thanks guys! :-)

Hello,

I got the same warning when I tried to read a CD Backup disc in a CDR drive.

The Plextor above should get this warning. Any ISO CD should do fine in the Plextor drive.

Yes, there's a setting under 'Advanced options' in the ExtenDOS
installation/reconfiguration program (INSTALL.APP) to use SCSIDRV or
ExtenDOS internal routines. The default is to use the SCSI driver, if
available for that device (which it will be when you've used the auto
configuring option in HDDRIVER).

Roger

If you are in the Charlotte NC area and are interested in a massive ST collection, please contact me at: atari_st@yahoo.com

Local pickup only....way too much to ship

Sample:

Mega STE
1040 STE
520 STFM
520 ST
520 ST with switchable TOS
5 to 6 Monitors 1425, SM124 (2 or 3), Mag. Color, (2) Atai color etc
500 + floppies slammed with software
50+ Software titles in boxes
Old BBS System from Atlanta GA with two MFM Drives with an Adaptec card
Several SCSI Hard Drives
Much Much More

I'm interested in the Mega and the 1040 and I'm flying down through there
(to New Bern) for vacation, unfortunately Charlotte is a bit out of my my
way.   For a falcon, I'd drive it ;)

Thanks,
Mark

Hello,

Bit of a whim this one.. Would anyone know where low profile 9-pin
dtypes can be sourced, preferably in the UK? Something like on the ends
of the cables here; http://www.ardisoft.de/Produkte/Jerry_ST/jerry.jpg .
Closest I've been to finding them is small computer shops who want
megabucks , or far eastern companies who want to sell 10,000 of them.

Tnx,

Aly.

Thanks Roger. I guess you already read my earlier posts, it was bad
hardware on the older Plextor drive.

Still, this brings up another question for me - what difference, if any is
there between using the SCSI driver, and ExtenDOS's internal routines? Any
advantages either way?

Thanks much.

Hi,

I got errors when trying to unpack the zview6.lzh archive from Zorro's website. The problem occurred when using the lha command on both my SpareMiNT system and my Linux Fedora Core 3 system. Anyone else experienced similar problems ?

Then I downloaded the zip archive from the chapelie ftp site and this one unpacked without problems.

ZVIEW6 is working great. I really appreciate the possibility to have a image & PDF viewer on my ARAnyM boxnow that doesn't require NVDI or the GEM XServer. A zoom function would be welcome, but I'm sure that will be added in the near future.

I have a problem though with PDF files with music scores that I created using Mup (Music Publisher) and ps2pdf (Ghostscript). ZVIEW displays the lines and beams correctly, but not the noteheads. I'm having the same problem on my Linux box when using gpdf, no problems when using xpdf or ghostscript for viewing.

Music PDF scores that were created by abcm2ps + ps2pdf are displayed without problems.

abcm2ps and ghostscript (ps2pdf is part of the ghostscript distribution) can be found in the SpareMiNT RPM collection.For mup go to www.arkkra.com or download the SpareMiNT version from
http://www.home.zonnet.nl/m.tarenskeen/download/mint

Hello,

When trying to get hexen to work (because of some endianness problems), I
had to add a small fix to Heretic also.

So now both games are up to dates.

Try Maplin, Rapid Electronics, Farnell and RS.  Try Ebay as well.
Sometimes it's actually cheaper to buy a cable, and chop it up than buy
the parts to make one.

Ronald J. Hall wrote:

> Still, this brings up another question for me - what difference, if any is
> there between using the SCSI driver, and ExtenDOS's internal routines? Any
> advantages either way?

Always use the SCSI driver if more than one software package (note that a hard disk driver is such a software pacakges) accesses IDE or SCSI devices. Otherwise one software packages might change SCSI bus signals without the other package knowing about it, which can lead to problems. Additionally (but for the same reason), you cannot use MagiC's background DMA without ensuring that all SCSI-related software uses the SCSI driver interface.
The fact that it can be dangerous to let several independent programs use the SCSI bus as they want to was one of the reasons why Steffen Engel designed the SCSI driver interface years ago. On other platforms, like Windows or Linux/Unix, such an interface is the only way to access peripherals.

CAF users know what it means if a software does not use the SCSI driver but SCSI code of its own: They cannot use any hard disk driver they want because the CAF SCSI code results in incompatibilities.

Hiya,

Nope, not suitable for the application here.  All of the Maplin, Rapid
etc. offerings are standard industrial D-types which barely fit into an
ST's mouse port.  As for buying an existing cable, when mass producing
something I'm not sure the customers would be happy paying an extra �6
for a chopped up 1.5m Atari extension cable when the slimline D-types
are out there.  Just don't want to buy 10,000 of them.

The slimline plugs/sockets that you put together yourself are out there,
though manufacturers who use them won't tell you who their suppliers
are.

I need slimline sockets, about 100-200 of them.  Years ago Amstrad
bought up a company's entire stock for their joysticks at something
silly like a penny a piece.

Aly

Well, I thought that was what scrolled up on my Mega STs screen, but
considering I really had the CDR issue on my mind, I could have easily
made a mistake. :-)

Thanks for the help/advice!

Okay. Thanks for the explanation Uwe! :-)

Yes! Mostly the file (1,6 MB) isn't complete! Zorro's Apache/ProXad-free.fr-server often simply cuts the download...

This is a known problem.. I will change the link in my webpage to the
chapelie FTP.

> ZVIEW6 is working great. I really appreciate the possibility to have a image
> & PDF viewer on my ARAnyM boxnow that doesn't require NVDI or the GEM XServer.

Thanks :)

Can you send me one of this PDF?

zorro271-1@yahoo.fr

You will need only to make the little computation, it's my anti-spam :)

Ciao,
Zorro

Suddenly everything is working perfectly here, even better than with gpdf
! But if I find such a problem again I will send you an example.

I was loading a game last night and my 1040ST crashed in the middle of
loading. When I rebooted it, it would no longer access any disk. It
behaves normally on reboot in that it seeks a disk if none is inserted,
but if one is inserted it quickly goes to the green desktop exactly as
if it had a blank formatted disk inserted. It views every disk as a
blank disk.

I have swapped the drive, and it isn't the drive, so it must be on the system board.

Any ideas? worth fixing? I hate to toss it, as it is barely used in mint condition, rubber feet and all, no discoloration etc.

thanks

Andy

I've been looking around for a 68881 math co-processor for my MegaSTe, and a dealer told me they had found a second hand one, but wasn't sure about the socketing.
They sent me the following photo:

http://home.c2i.net/w-460389/68881.JPG

This doesn't look like something that'll fit in the existing socket, but I may be wrong, and there may be adapters available for all I know.
Anyone know if I can use the one pictured above in my MegaSTe?

Thats a PGA. The socket in the MegaSTe is a PLCC. The PLCC has legs all
around the outside edge, not all across the underside like the PGA.
Look at the following: <http://www.ontrak.net/plcc.gif> - thats a PLCC.

Coda.

Unfortunately that's what I thought, which means I'm still on the
lookout for a 68881.
Anyone have one they don't need, or know of any good sources
where I can get one?

I have a 4meg Nova ATI graphics card for my Hades that is connected through
the PCI BUS. I got it from Homa Systems in Canada.

The Nova software is original version 2.61. at least from the disk label.

Still not sure if I have the 1 or 2 meg version. If each chip is 256k, then I count 2 megs. With room for 2 more megs.

The manual just says the more memory you have the higher the resolutions.

Even if it turns out to be a 1 meg version. It is still Great for a MegaSTE.

The VME device is interesting as it would seem one could use a different graphics card if one had the right drivers.

As for adding Memory, I have a EPROM BURNER that will copy Gals nicely
if I need that for the extra memory project and can get ahold of one.

Or with the software, it would be possible to update the Gal using a new one.

Great little Chip Burner I have here.

My MegaSTE is mostly used for the CYBER SERIES of programs like CAD 3-D 2.0.
The addition of this graphics card will help speed along the process of updating those files, with GEM compatible Graphic Software. And DTP Work.

Even the Vortex 386SX may benefit as it includes a ton of drivers. Not sure It would work with the Nova, but with a little tinkering anything is possible.
Heck, FalconSpeed, works with Screen Blaster II for higher resolutions.
And there are some special Screen Drivers as well.

The Modem Maddness 2 CD for Dos has tons of fun stuff to explore.
BackDoors, BBS's, Terminal and Net software, Ham Radio and more.
I get a kick out of running any Dos stuff on Ataris.

I am interested in how the Nova graphics card connects to the Falcon.
All Ataris are mentioned in the manual. However no info is given on the

connection to the Falcon. I'm sure there is a different connecting device other than the Mega STE/TT VME adapter. What type of adapter is used and is it connected directly to the Falcons internal expansion slots?

Also the MegaST is mentioned in the manual. Will the VME adapter connect the Nova to the internal expansion slot in the MegaST? If so, that would be cool for my JRI Genlock in my MegaST4.

My First ST was a 1040STE, and ever since, I wanted to improve the graphics modes.

Since the MegaSTe is Faster, with internal Hard Drive, Tos 2.06 and I have the hardware to expand hard drives and CDROM/CDR on the DMA port, Onlong with much better Video Modes for GEM Graphics Work and DTP work. Along with some DOS stuff for Fun, I finally have a Atari STE that I've always wanted. Not meaning to brag. As it has taken me too long to get the stuff for such a setup. But its a nice feeling when you have an Atari that you wouldn't trade for the latest Win machine on the market. I have a Vidi ST-12 or a VideoMaster STE that I can use on it, as well as SCAN X with a UMAX FlatBed Color Scanner. Good Printers, Happy Discovery Cart., Spectre GCR cart, Even a SuperCharger, And a good GoldenImage Hand Scanner. And the Midi Network Kits with software and manual will really help to transfer files over to one of the Falcons if all goes well. I've a ton of good ole Atari Applications and Games. No way I'd trade in all this wealth and especially knowledge on a Win. Machine.

But I am still a Falcon Nutt, but my CAD 2.0 updates can be done on the MegaSTE now as well as my DTP stuff which will free up a Falcon for me.

Now if I could only get my dream Falcon machine, I'm close....

But in my opinion a working stock Falcon is a dream machine, if you have the right software and use its capabilities to the fullest.

I know I am rambling, but what the heck. If I can inspire another Atari User to

keep using his computer and find new things to do with it, then that
makes me
happy as the Ataris are too good to just abandon.

For me, a new area I am going to explore is the MIDI side of the Ataris.
As, I am into Video and D2D recording. I want to see what MIDI can do as
there's
a ton of software out there thats FREE. Good stuff too!

Rory,

I have the game. Like brand new. I've never played it.
But not sure I want to get rid of it at the moment.

I'll take a look at the verticle and horizontial stuff as well and see
if I can fix it or
send it to someone who can. I really need it fixed or replaced.
Heck, I'd love to have 2 or 3 or em.

Anyone in the USA or Canada have alot of SCSI Cables to sell or trade?

I need, 50 pin Male on one end that will connect to a Falcons SCSI II
port.

The other end can be a 50 pin Centronics or another 50 pin Male SCSI
connector
just like the first one that will connect to a Falcons SCSI port.

Contact me if ya have em for sale/trade.

Will also consider just the 50pin male connectors without cables.

ALso, Need some 68 pin SCSI adapters to 50pin SCSI for changing 68pin
SCSI III hard Drives
to 50 pin for easier use.

ANd or, need 68pin SCSI Cable connector on one end and 50 pin male SCSI
on the other.

Got something that might help me out?

E-mail me at:

>I am interested in how the Nova graphics card connects to the Falcon. All Ataris are mentioned in the manual. However no info is given on the connection

The Nova cards are PC ISA cards with a basic interface for whatever
Atari machine you had. There are people here who have the Falcon Nova,
I have never seen one in the flesh, I think its a Falcon bus -> ISA
adapter basically. The TT and MegaSTe are VME -> ISA adapters. I would
like to know if I could talk to another ISA card from my TT or MSTE
such as my Yamaha SW60XG.

>Mach64. I don't think the NOVA VDI driver does anything with the extra
>2meg, available resolutions remain the same as far as I can tell.

That's not true. With a 4meg card you can have a resolution of 1280x1024 with
TrueColor, with a 2meg NOVA only in 256 Colors. I only have a 2meg version. :-
(

>Gehard is quick to respond to questions about Photoline on the PC, he

Yes. That's what it is. Falcon bus->ISA plus ATI Mach64 ISA card (with DRAM or VRAM, 1, 2 or 4meg) and of course the driver software (sourcecode available).

What computer are you using. I know when I upgraded my PCI Mach64 card to
4meg, I was able to get more resolutions on Hades060 than I did before...

I got most of the above from the Internet at various dealers. Just got an adapter (centronics to 68-pin) for a new 9-gig hard drive. Works great...

I have version 2.67 for my Hades,, but it is mainly for 68020/68030 machines.
Could use another upgrade, but I doubt if we will see it. It would be nice as
the only color resolution that operates with no error is 256 colors.

```

Ok, I have wondered about using different graphics cards with the VME device.

So, If I were to look for another graphics card to use with the VME device it should be an ATI type card?

For example if I could write my own driver for the graphics card. What type (model name) of card would I look for?

And of course I would want the names of any cards that would work with the VME device that drivers and etc already exist for.

Actually, the VME device for the MSTE/TT Would be a good starting place for a Newer Graphics Card. If someone would write the drivers and etc.

According to the manual the card will work with a MegaST, but you need a extra part called a MegaBus adapter that the card uses inside of the MegaST.

I have no Idea what it would look like.

Also, Can I use this Nova 32 in with a Falcon, if I have the right connector? If so, what would the connection look like?

My Nova 32 is in a Black Box, I took a look at the main graphics chip
and
it is a ATI MACH 32. I also notice 2 socketed ISA chips labeled ODD and
Even.

Anyone know what those are for? They are dated 1994.

And after looking at the memory chips, I am fairly sure its a 2meg unit,
which is good
as that will allow me to reach higher resolutions with more colors.

According to the manual even a 1meg Plus 32 will get the following....
640x480x24bit
800x600x32K
1024x768x256

Which would be enough for me, but 2 megs should do alot better. And the
board
has room for another 2 megs of chips. The spaces and holes are there,
just looks
like to me one only has to solder them in. I have to at least try and
see. 8-)

If I can get the memory chips, it would only take around an hour to do.
I will use
sockets just in case there are problems. This is a interesting project,
one that I will
do as soon as I can get a source on the memory chips.

Have a few Items for sale.

Atari Falcon 4meg board. Like New.
Price $35.00 Firm.

Atari VideoMaster Falcon Cartridge with RGB Splitter,
Like new, with manuals, software and original Box.
Price $175.00 Firm.

TruePaint, Like new 3 original disks with original Manual.
$25.00 Firm.

Atari Falcon RGB Video Adapter. New in Package.
$20.00 Firm.

Original Atari Falcon 030 Manual package with software.
Includes....

Original Falcon 030 owners Manual,
Extras Manual for the Audio Fun Machine,
Falcon-D2D Recorder, System Audio Manager (SAM),
Breakout, and Landmine.
Atari Works Manual.
Also, comes with the original SpeedoGDos Disk software
that came with the Falcon 030.
Original Atari Works Software Disks that came with the Falcon.
ANd Original Falcon Extras Disk, that includes the Audio Fun Machine,
Falcon-D2D Recorder Software, System Audio Manager (SAM),
Breakout and Landmine.
PRICE- $50.00 FIRM

It does. I recall using terminal emulators with mine back in the early 1990s. It also makes the ST's parallel port look like a serial port to the Mac software, so you can print to a parallel printer (if you've got appropriate Mac drivers for it).

Yep this is great stuff, feels like using the old editor but without
its disadvantages. At last, GFA is fully GEM friendly :)

Thanks!

/Joakim

By Al Fasoldt

Copyright � 1991, The Syracuse Newspapers

There was bedlam in Reston, Va., a town near Washington, two weeks ago. A man at the front of a conference room at the Sheraton was passing out free Macintoshes -- hundreds of them. It was Dave Small at his best. Small, the inventor of the plug-in device that turns ST computers into Macs, told the crowd of ST users at a computer fair that he wanted to thank them for helping make his unusual product a success. And he then reached into a large box and tossed $300 Spectre 128 emulator cartridges out to his fans. The crowd reacted like pigeons that hadn't been fed for weeks, grabbing the palm-sized devices as they sailed across the room. I was in the audience, returning with my wife, Nancy, from our honeymoon in the mountains. I didn't catch an emulator (somebody alongside me did a flanking maneuver and deflected the one that was coming my way), but I did get to see Dave Small and his miracles in action. The first, of course, is his Mac emulator. With the ST's screen size being larger than the standard Mac's, an ST-Mac is a beauty to behold. Two million STs have been sold worldwide, and thousands upon thousands of them turn themselves into Apple Macintoshes every day at the click of a mouse. The second was something he calls the SST. It's an ST that runs at 40 megahertz. It's faster in every way than Apple's most expensive Macintosh, and a lot cheaper, too. Dave Small is one reason the ST hasn't disappeared from the American market. The company that makes the ST, Atari, had nearly abandoned the U.S. market for Europe, but Small and a few others have helped keep interest alive here. It's paying off. An advanced ST, called the TT, is now available to consumers in this country, and the company is taking orders for a notebook-size ST, too. A pen-based ST notebook computer is expected out next year. The crowd in Reston gave the TTs that were being demonstrated there high marks. But they gave their biggest thanks in the cheers that went out for Dave Small.

Not trying to rip anyone off on the VideoMaster Falcon and Splitter.

It is like new. Actually, under priced. Contact B&C or Best Electronics
here
in the USA and see what you'll pay for a Falcon only version with RGB
Splitter!

I payed full price for it, much more than what I'm asking. It has all
manuals, software
even the colored filters that have never been used.

Not many of the Falcon Only versions around either.

If no one wants it at this price, I'll put it up on E-Bay and will
probably get more.

Not trying to sound greedy or trying to be an ass. But very few have
gave me anything
for free, and I usually have to pay out the butt to get the good stuff
from some on this
newsgroup. But have had very fair dealings with others here. And I much
appreciate
those folks.

I think its a fair price, considering the condition and what all comes
with it.
And I normally include a nice Bonus to anyone who deals with me.

Did you get that Fiver from Ebay in the USA or Ebay in the UK?

I notice that alot of Atari items from the UK are on the US EBAY site.

And from month to month it keeps growing.

This tells me that either Folks selling Atari stuff in the UK are
getting more
money for their stuff from us Greedy Americans or no one in the UK wants
it,
Or they feel it is overpriced.

Think I'll start selling stuff on the UK E-BAY. How about some Coal for
those
long cold Nights that are coming this winter with the outrageous Oil
Prices?

I just have to go out side and dig it out of my hillside. Put it in a
good bag or
box and sell it by weight. 5pounds, 10pounds, and etc.

Hell, I'll be rich in no time!

Heres one for you all. I met Dave online via Toad computers Atari forums. He was getting rid of a bunch of Atari computers. Really was going to give them away to anyone in colorado that would come get them. So I replied to the message and noticed the email address was something like dsmall@****.com. I thought to myself thats weird maybe its really Dave Small. So a day goes by get a reply telling me what he had to get rid of. Since he was on a large IP he had a IM program that I began chatting with him about the Atari ST. He then asks me if I know about the Spectre GCR. I tell hime that I do and asked if he was indeed Dave Small, he replies yes thats me. So to make a long story short I kept tring to get the shipping rate of the equipment and he would never get it to me. I lost contact with him and a few weeks later 2 very large packages arrived at my home. It was Dave Smalls TT030 and a TTM195 monitor. I sent emails thanking him and asked him to let me pay the shipping costs. It never happened. So the center point of my atari collection is my TT030 that was owned and used by Dave Small that he shipped to me for FREE and gave to me for FREE. What a great guy. You know I watched that thread on Toads site to see if anyone ever asked him any questions. Nobody ever did.

He said his kids were doing great and he was recovering from broken arm(if my mind serves me corretly). No longer married. But seemed like the Dave Small that everyone loved.

Don

litter!

That says it all really. Only desperate people pay those sort of
prices.

>I payed full price for it

Goes with the territory.

>Not many of the Falcon Only versions around either

I bought mine direct from Hisoft 2 years ago for =A325.

>If no one wants it at this price, I'll put it up on E-Bay and will probabl=
y get more.

Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.

>Not trying to rip anyone off on the VideoMaster Falcon and Splitter.
(forgive the upside down quoting)...
We know that.
```

> Price $175.00 Firm.

Can you explain what "Firm" means, being UK side im not familiar with
the term.

Coda.

all the stuff I sold was on UK ebay, I always offer to US, most people in the US want upgraded ST's... and yes your item is probably worth $170, though its only worth what people will pay for it, I spent around �200 on each of the Atari's I upgraded, people wont pay that much for one, so I've lost probably over a �1,000 on that lot alone, I lost about the same on the video stuff aswell... and yes I get a great loss for providing people with cheap stuff, something which I am not doing any longer.

If you feel its value is $170 then you keep it, its only *worth* what people will pay for it. The US market is a lot bigger than the UK one in some things... offer your item on global ebay, start bidding at $5 if you are lucky someone will bid, if your VERY lucky you may get a bit more. I really hope you do get the full asking price.

I paid about �200 for my VIDIST kit, its rare and should still be worth a lot, though im not even going to try and sell it, its �200 value to me probably �1 value to someone else. Nobody is having a go or telling what to do, but hey I would like �500 for the my video stuff, I could wait for the next 50 years before someone would pay it, as I wanted to clear the stuff out of the way I let it all go for a pathetic �5.... You either put it at a low $5 or be wait until someone will pay the full amout you ask, one day someone will but demanding such a price in a "or else" fassion is never going to work.

List it on ebay for $170, just remember you may have to keep listing it for the next several months if not years, the only people who are making anything is Ebay, probably $5 each time you list it, if you list it 10 times and it does not sell then your $50 down, and you STILL have to sell it then. I know this ALL to well..... its just some friendly advice which people are offering you, just be warned that holding out for the full asking price is likely to cost YOU a lot more than you will will sell the item for in the end.

Chris

what gets me is places like atariworkshop have listed USED ST's for like �200, I mean who in thier right mind is going to pay that when they can get one for �20 with piles of cables, games etc off Ebay... they have some nice stuff which I would like though I aint paying 15 years ago prices for stuff today!

On the other side of the coin, they probably paid alot for the stuff when it was new and they want to get thier money back, wouldn't we all, but prices drop and you have no choice but to follow..... in theory anyways....

>Not trying to rip anyone off on the VideoMaster Falcon and Splitter.

It means he aint going to accept anything else for it, if someone offered
$170 then he wouldn't take it.

I've got Dave Troy's Mega STe keyboard!

Toad Computers...what a great bunch of people that was (are!). Some of my
most enjoyable Atari memories are of dealing with them. Man, the money I
spent there! Don't regret a single red cent. :-)

Okay, I'm desparate. :-(
```

I paid B&C Computervision $150 USD earlier this year for my VideoMaster
Falcon, without the RGB splitter.

I guess I could have waited and got it from some place like Ebay for less
money (if one ever showed up) but I feel that its worth it *to me*.

I suppose it all comes down to the eye of the beholder, eh? One mans' gold
is another mans' garbage... :-)

Hello,

Is there a place where I could have a full description of this item ? I
don't remember I read anything about it in the past.

Regards,

J.-Luc

I have substantial doubts about the possibility of using other cards. It's somewhat likely that this VME card is not really an ISA bus implementation so much as a minimum implementation to make the ATI Mach series cards work. If you need a GAL update just to move from Mach32 to Mach64, you'll need a GAL update to do much else other than video ram upgrade maybe. If you look at the ethernec for instance, it's supposed to be for Ne2000 ISA cards, but the reality is relatively few of those cards work. If you go to the store and buy a brand new netgear NE2k compatible ISA card, guess what.. it won't work. You need an RTL chipset card for the best compatibility though some others work fine as well. It was built on that RTL chipset.. I forget the digits. I'm thinking the Panther upgrade for the Mega ST might actually be a full ISA bus.

The CTPCI thankfully will be a full REAL PCI bus. Meaning some day when I want to plugin a firewire card or something, it's a simple matter of drivers... simpler than you think really thanks to linux. Hardware has always been our unicorn.

Thanks,
Mark

Well, I thank you for the kind offer anyways. Honestly, I never even
thought about asking on here for one, although it should have been the
very first resource I turned to.

A fool and his money, eh? :-)

Hmm, do you have the RGB splitter though? I wouldn't mind getting one of
those to go along with it, for a fair price.

Hello,

This is a straight port of xmame to the Atari platform. This is an EXPERIMENTAL release, i.e. the program may not work at all. It is sure that if you encounter a problem, I will not be able to help you.

However, you can still drop me a mail about your experience trying to run this beast.

Hardware/software requirements:
- 68020 or higher CPU.
- FPU.
- 32 MB RAM (just to load it), so you'd better have more than 40 MB free if you want to load a game.
- True colour video (Falcon, or any machine with graphics card), i.e. 15, 16, 24 or 32 bits video mode available.

1. It wasnt Phantom that wrote that, but Mark.

2. That statement was in the context of using other GFX cards, with the
NOVA's VME/ISA adapter.

Coda.

Mame needs some serious power.

Don't expect to be able to run much more than the original Pacman. But a
lot of old games should work at least a little.

Mark

I have 3 VideoMaster Falcons with Splitters.
And 1 ST/STE/Falcon version.
ALso have
Vidi ST with RGB Splitter and Vidi ST-12.

2 Expose Digitisers
3 Genlocks
and some other misc video stuff.

I was just trying to offer one of the extra VMF carts at what I though it
was worth. Thats all.
No one has to buy, I'm not twisting anyone's arm.
And I really don't care if I sell it or not as I use them.

If I were out to make money, I'd be selling something other than Atari stuff.

And I do think it would sell at a good price on Ebay. Because, I have never seen
one on there. And most good stuff goes for a high price.

And if someone did pay my asking price, it's there business and mine.
Calling folks suckers in someone else's thread isn't right.

And really it's nobody else's business.

What was done here, is no different than going into someone's place
of business and telling the customers in there that they are suckers
if they pay that price for a certain item.

There are laws against that sort of thing. Maybe not on the Net.

I just don't get it, why try to devalue my stuff. If you don't like it
thats fine, But I don't think you have the right to come in my thread
and call someone a sucker if they buy a item from me.

I have never done that to anyone advertising an Atari product on here.

But it seems everytime I list something on here, someone from overseas
has something nasty to say about it. Fine, It goes both ways.

I can be a Big Bastard when pushed to far.

Don't feel bad for what you paid for it Ronald.
At least you know you got a New one and not a worn out hand me down.
These used to cost alot more than that.

As for the Splitter, I'll see what I can do for you if you can't find
one at
decent price.  Maybe we can do a trade or something.

No. We have every right to say:"ppl this item can be get cheaper". No one call customers suckers. I dont mind how much one pay for a product, he has right to know whole picture, aka others prices.

> There are laws against that sort of thing. Maybe not on the Net.

There is no law for such thing. Maybe in US. U have right to set price, cusotmers have right to know they are high/low whatever...

> I just don't get it, why try to devalue my stuff. If you don't like it
> thats fine, But I don't think you have the right to come in my thread
> and call someone a sucker if they buy a item from me.

Again, u are repeating, and twist to make us look bad: We dont call anyone sucker, especialy not the customers. We have every right, to tell customers that certain thigns can ge get somewhere cheaper. If i get XX item for 20$ and sold it for 20$, i have right telling people that 200 may be too much. What they will do next, is their problem...

> I have never done that to anyone advertising an Atari product on here.

Bottom line, this place is not proper one for advertising in first place.

> But it seems everytime I list something on here, someone from overseas
> has something nasty to say about it. Fine, It goes both ways.

Oh, so now its political problem? Complain to Bush, he may drop a bomb or two. I dont mint overseas or not. I already bought stuff and send them to ppl overseas. I also bought items from US persons, never had a prob. NOTE: buying in US is exactly the same "oversea" to me as is Europe to you.
I dont have problem with that. And i dont see why saying:
"guys hold your horses, Falcons can be get from 100usd on in Europe. Rethink, u may get it way cheaper that way, spending extra money for add-ons.." fall in category "someone from overseas has something nasty to say..) And sending item from US to Germany or UK, is exactly the same as sending it from UK to Slovenia or Greece etc.. A tad longer, so it is not such problem as i keep hearing all the time...

All US guys bought CT60 at SAME prices as we did with overeas posting, so why not extend that to other things? Or u just have a problem with us down here if we notice ppl about something? That happens u do not like... Or u are paranoid, and we all plot big conspiracy again US here.... This is pathetic.

> I can be a Big Bastard when pushed to far.

No need pushing, simply pointing out is enough...

Uh-huh.

Gotta love the sales technique. But then, when I was in the US, I saw the word "Firm" in an advert for used kit, and ignored those adverts.

Dude, dick-waving on Usenet is really sad. Especially when you're trying to sell some overpriced obsolete junk to people.

Richard

Just my opinion here, so everyone can take it as far as it goes, but let me point out some things:

1. Phantomms prices are in range with what dealers are selling it for here in the US (and cheaper, if you throw in the RGB splitter).
2. I might have easily missed something, having been out of the Atari scene, before re-emerging in the last year but I've not seen -1- VMF advertised here, or on Ebay, until Phantomms post. So my assumption is that they are not as common as leaves falling off trees.
3. Hmm, I guess that, in some peoples opinions I paid too much for mine, but I wouldn't consider it to be obsolete junk at all. (if you do lean towards that argument, then you would have to apply it to *all* our Atari hardware and software <grin>).I mean, I use it, I like it, it works for me. Aside from that, what choices does a Falcon user have if they want to play around with recording video/audio? Not a lot, that I can tell.

One user did say that they got one for 25 pounds(?) from Hisoft in the UK. That sure sounds like a bargain to me, when its converted to US dollars but that is in the UK.

I personally have no problem with people buying/selling on usenet. It is for the users, right? Is there a comp.sys.atari.marketplace or something like that? If there is, it might be more appropriate there. Otherwise...

As I said, just my opinion and 2 cents worth... <smile>

Later gang.

True, but there is a point where common sense has to step in. If the cost of sticking this stuff onto a Falcon outweighs the cost of, say, an old iMac DV and a USB or Firewire video interface, then really, why would you want to use the Falcon?

I moved from Falcon to Mac for music, because whilst there is a certain cachet to using the Falcon, only the most determined retrophile would insist that it was in any way better than the same sort of money invested in newer Apple or PC hardware. The dealer prices in the UK of around �450 for a Falcon, �200 or so for a better MIDI interface, and GodKnowsWhat for DSP audio hardware, were vastly in excess of the cost of a decent iMac, a 128-channel MIDI interface (by the same manufacturer!) and good quality Audio I/O.

What things are worth, is what someone is prepared to pay for it. I'm not denying that Phantom can pretty much ask whatever he wants and hope for a sale, it's a free world, but getting into "I can be a big bastard when pushed" posing when trying to sell stuff strikes me as an exercise in futility.

Richard

Okay, I'll concede that point as far as cost goes. However, think along these lines, I'm not here because of cost. I'm not here because platform x does something better or cheaper than platform y or even z.

I'm here because I love Atari. Especially my Falcon. If it was all about cost, I would stick with my 3 comp Linux LAN & laptop, and never do anything with Atari hardware/software.

Its love of the machines, the community, and pure old nostalgia. :-)

From your viewpoint, I understand what you are saying. If I were a music professional, I would absolutely agree with you.

Its a hobby to me. Its that "for the love of" concept. The best times I've ever had, computing wise, was with Atari. I still have more fun, and get a better sense of achievement when I do things with my Atari's than I do with anything else. I was simply overjoyed when I was able to get my BBS online, available for Atari users world-wide once again. I could have done it (easier/cheaper) with a Linux BBS, but it wouldn't have been the same. I really, really like Linux a lot, for example, but its -just- not the same. I don't do "windows" at all. Never have. Never will. Atari (MINT) was my stepping stone into the Linux world. Just something else I have to thank Atari for.

So many memories...its a good fight, just keeping them alive. :-)

See ya Richard!

When i found my Falcon I was recording music on a Roland VS, and
sometimes on a PC at work. The Roland gear was nice, but the "state
of the art" PC gear was terrible, simply because it ran with Windows.
 I got into the Falcon mainly because I could get the gear for much
 less (a few years ago) than buying the Roland gear or similar setup
 for my home studio, and I was an old Atari user from way back who
   had never even experienced the Falcon. It was a great decision. I
 love my Falcon and have continued to improve upon it. It is not
 only a great home studio solution, but I've had loads of fun
 learning Mint, adding the CT60, etc. Although I've gotten most of
 it for bargain prices, it is worth the price of "new" gear to me. I
 have an iMac G5 at work now, and I love that too, but I wouldn't say

it is better than my Falcon setup for the money involved. I say let individuals post their gear here at ridiculous prices if they want. At least it stimulates some conversation and sometimes I hear about gear that I didn't know about, even if I don't want to pay those prices. If I have something to sell, I'll list it "make an offer" to help out other Atarians.

Every game I try on my CT60 falcon works but is super super slow. It's a
shame there's not special better 68k emulation that isn't really emulation
;) Especially considering a LOT of these games use 68k chips and Z80's
can't be that hard to emulate? Kudos on a good port!

Thanks,
Mark

I agree you have the right to tell folks that a item can be gotten
cheaper.

But I don't think you have the right to come into my thread or
advertisement
and say that.

If what you are saying is true, then anyone can hack into a Business Web
Page
and say Hey you can get it cheaper at XXXX.

Try doing that at some of the major Computer Business Web Sites and
see what happens to you.

>

> cusotmers have right to know they are high/low whatever...

Net time I'm in the UK, I'll be sure to put your knowledge of the Law
to the test. I'd like to see someone from the UK go into a business and
do that. Anyone have the guts?

>
>
>   Again, u are repeating, and twist to make us look bad: We dont call

> may be too much. What they will do next, is their problem...

Below is a direct quote from CODA....

(Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.)

End Quote

Sucker wasn't mentioned but certainly implied.
If you need the whole posting with headers for proof, it can be
provided.

If you want to tell someone here that a VideoMaster Falcon only version
with RGB splitter, original manuals, software and box can be bought

cheaper somewhere else. That is fine with me.
But do it in your own Thread. Not mine!
It is most dis-respectful to do that in someone elses thread at the
least.

I don't come into your thread and do you that way.
But if it continues, I will.

>
> Bottom line, this place is not proper one for advertising in first
> place.

I don't see why not. It is Atari re-lated and folks have been
advertising
Atari stuff in here for years.
According to you, The CT060 shouldn't be advertisted in here.

Well how the hell, does anyone suppose to find a Atari product that
they might want? Google? E-Bay? Sure you can search for items.
But if you don't even know the items name or that it was ever made,
then how else?

>
> Oh, so now its political problem? Complain to Bush, he may drop a

> as
> sending it from UK to Slovenia or Greece etc.. A tad longer, so it is
> not
> such problem as i keep hearing all the time...

Not political, to me. Just a Fact that every Degrading remark related to
my advertising has came from overseas, and alot are from the UK.
And have been done in my Thread or Posting. Thats a Fact.

Again, I have no problem with you or anyone else saying a product can
be gotten at a cheaper price. I like a good deal myself.
I do have a problem when it is done in my thread.
If you have such info, then post where it can be gotten at and do it
in your own posting. Not in my posting, or Web Page, or place of

business.
UNDERSTAND?

> All US guys bought CT60 at SAME prices as we did with overeas posting,
> so why not extend that to other things? Or u just have a problem with
> us down
> here if we notice ppl about something? That happens u do not like...
> Or u are
> paranoid, and we all plot big conspiracy again US here.... This is
> pathetic.

Fine, do it in your own thread or posting.

Your are trying to twist my words. I never said that one could not post
or say
that a item could be bought cheaper.
I only said, that if you want to do that, then do it in your own Posting
not in
mine.

Or do you feel you have the right to go into anyones posting, Web Page,
or Place of Business and do that?

I don't have a problem with any people as a whole, I am not that way.
I do not like someone who trys to devalue my stuff in my Face.
Which was what was done.

I like getting a good deal on items myself. But I don't go into peoples
postings and start a argument over a item they have offered for sale
just because I feel the price is to high or that it can be gotten
cheaper
somewhere else.

And I am still waiting for the info on where one can get a
VideoMaster Falcon only cartridge with RGB Splitter, Original
Manuals, Software and original Box. Like New for less than
$175.00 US?

>
> No need pushing, simply pointing out is enough...

You seem to be a expert at that.

Zorro,

ZView is looking really good especially the PDF viewer. I did a lot of tests
with Porthos and reported various problems to the author. ZView all ready
displays stuff that Porthos struggles with.

Is the Zoom feature not implemented yet ?

Regards,

Peter

Tosbox is nice, but outdated. Use Aranym instead.

Porthos doesn't work quite well with XaAES. Although much slower
Ghostview perform better then Porthos.
Zview looks promising indeed. It's reasonable fast and can display
most pdf-files.

Oh, I have heard it before, in this group a few years ago.
When some where complaining of Sigs being to long and etc.

The subject of the Sig did come up.
I bet I have it archived here somewhere.

Not sure what the official rules for Sigs in NewsGroups are.
Would be interested to find out my self.

Anyone have the URL for reference to USENET rules?

If not, I'll search for it myself.

```

Oh yea, I am still waiting on where that VideoMaster Falcon cart and
RGB splitter is for under 175.00US.

I'd probably buy it myself, unless it came from the UK.

> has right to know whole picture, aka others prices.

I agree you have the right to tell folks that a item can be gotten
cheaper.

But I don't think you have the right to come into my thread or
advertisement
and say that.

If what you are saying is true, then anyone can hack into a Business Web
Page
and say Hey you can get it cheaper at XXXX.

Try doing that at some of the major Computer Business Web Sites and
see what happens to you.

>
>   There is no law for such thing. Maybe in US. U have right to set

> cusotmers have right to know they are high/low whatever...

Net time I'm in the UK, I'll be sure to put your knowledge of the Law
to the test. I'd like to see someone from the UK go into a business and
do that. Anyone have the guts?

>
>
>   Again, u are repeating, and twist to make us look bad: We dont call

Below is a direct quote from CODA....

(Very unlikely. Why would someone bid MORE than they could pay a B&C or
Best? But then, theres one born every minute.)

End Quote

Sucker wasn't mentioned but certainly implied.
If you need the whole posting with headers for proof, it can be
provided.

If you want to tell someone here that a VideoMaster Falcon only version
with RGB splitter, original manuals, software and box can be bought
cheaper somewhere else. That is fine with me.
But do it in your own Thread. Not mine!
It is most dis-respectful to do that in someone elses thread at the

least.

I don't come into your thread and do you that way.
But if it continues, I will.

>
> Bottom line, this place is not proper one for advertising in first
> place.

I don't see why not. It is Atari re-lated and folks have been
advertising
Atari stuff in here for years.
According to you, The CT060 shouldn't be advertisted in here.

Well how the hell, does anyone suppose to find a Atari product that
they might want? Google? E-Bay? Sure you can search for items.
But if you don't even know the items name or that it was ever made,
then how else?

>
> Oh, so now its political problem? Complain to Bush, he may drop a

> say..) And sending item from US to Germany or UK, is exactly the same
> as
> sending it from UK to Slovenia or Greece etc.. A tad longer, so it is
> not
> such problem as i keep hearing all the time...

Not political, to me. Just a Fact that every Degrading remark related to
my advertising has came from overseas, and alot are from the UK.
And have been done in my Thread or Posting. Thats a Fact.

Again, I have no problem with you or anyone else saying a product can
be gotten at a cheaper price. I like a good deal myself.
I do have a problem when it is done in my thread.
If you have such info, then post where it can be gotten at and do it
in your own posting. Not in my posting, or Web Page, or place of
business.
UNDERSTAND?

> All US guys bought CT60 at SAME prices as we did with overeas posting,
> so why not extend that to other things? Or u just have a problem with
> us down
> here if we notice ppl about something? That happens u do not like...
> Or u are
> paranoid, and we all plot big conspiracy again US here.... This is
> pathetic.

Fine, do it in your own thread or posting.

Your are trying to twist my words. I never said that one could not post
or say
that a item could be bought cheaper.
I only said, that if you want to do that, then do it in your own Posting
not in
mine.

Or do you feel you have the right to go into anyones posting, Web Page,
or Place of Business and do that?

I don't have a problem with any people as a whole, I am not that way.
I do not like someone who trys to devalue my stuff in my Face.
Which was what was done.

I like getting a good deal on items myself. But I don't go into peoples
postings and start a argument over a item they have offered for sale
just because I feel the price is to high or that it can be gotten
cheaper
somewhere else.

And I am still waiting for the info on where one can get a
VideoMaster Falcon only cartridge with RGB Splitter, Original
Manuals, Software and original Box. Like New for less than
$175.00 US?

>
> No need pushing, simply pointing out is enough...

You seem to be a expert at that.

Haven't read it myself in a long time, but I remember a few general things. Like no more than 4 lines. Also, its considered polite to leave politics, religion, etc, out of .sigs, essentially anything that might be considered inflammatory.

Was that a RFC, "Request For Comments' document somewhere? Can't remember off the top of my head.

AFAIK this is a discussion group - someone post something, the others
discuss its implications, isn't it?

I paid for the right to use the NET.

If you guys want to start arguments over someone offering something for
sell. You are just going to turn this newsgroups into the ones filled
with
Spam,  Non related Atari stuff and ruin one of the last places Atari
owners can post messages in a non Web format.

I did not start this.

Just keep on picking on everyword I say, go ahead.
Mess it up for everyone.

Cause I dam sure don't give a rats ass now.

Hello :-)

Have been reading through the posts on here and thought it was time to answer some of the queries directly.

RE: Wheel mice and Eiffel
I would suspect that this works via Eiffel as the entire keyboard MCU is replaced, therefore allowing the additional 'super' features of the PS2 mouse to be realised. It is likely that these are represented as regular keystrokes which are interpreted by a software driver and then represented.

Without replacing the keyboard controller and opening up the case or de-standardising the ST hardware, there is no possible way to use anything other than LB/RB/XA/XB/YA/YB.

The only short-cut hack possible would be to have the third button act as either a double-click motion or to 'hold' onto a paned selection when dragging until it is pressed again.

RE: USB support
At the moment that's a no-go. USB is inheriently a substantially more sophisticated standard than is realised among the masses. That's not to say that it isn't possible. A third party bolt-on is currently required to interface USB to programmable interface controllers, thus pushing up the price with little gain other than novelty.

RE: USB vs PS2 lifespan
It's unlikely, very unlikely that we'll be seeing the back of PS2 anytime soon. The main issue that I used to have with USB hardware in a support role is that the equipment isn't recognised until after an O/S is used. For example, if there was a laptop with a malfunctioning keyboard and there were no PS2 ports to connect a desktop unit it was back-to-the-manufacturer time to find out that it was a corrupt bios that had caused the problem. All very unnecessary and further control being taken away from the user.

Saying that though, laptops are now shipped without COM or LPT ports. Overall I feel that the consumer is getting a bad deal in the interests of manufacturers pushing for change that is supposedly better. Might lower costs perhaps, but there's going to be alot of mighty useless computer equipment in the future. Certainly not my idea of environmentally friendly. We are all here on this newsgroup afterall, supporting a computer (Atari) which is 20 years old and still perfectly usable.

RE: PS2 mice which are supported by this converter
ALL PS2 mice are supported in standard X/Y/2 button mode. This is the default mode for all mice, even super-charged ones with jet engines. There are specifically 2 type of mice which are endorsed here, the Microsoft Optical Mouse, and the Logitech trackballs. Regular balled mice are perfectly usable although suffer from the reasons which pushed us to buy optical mice in the first place.

RE: Tracking speed
The PS2 converter tracks faster than the ST mouse, at approximately twice the speed. Also, movements are not misinterpreted should the mouse be moved exceptionally fast across the desktop, as occurs with the original Atari STM1 mice. Why anyone would want to do this is anyones guess.

RE: Future inclusions to the project
It has been discussed between myself and Chris, to add support for the Commodore Amiga since this is just a case of changing the ports in the chip doing the conversion. Another idea is to enable the tracking speed to be changed. These options would be set by for example, pressing both

mouse buttons within 2 seconds of interface-power-on. Pressing the left button would toggle Atari/Amiga mode, pressing the right button would toggle between 1 report/mm, 2 reports/mm, 4 reports/mm, and 8 reports/mm, pressing both buttons again would leave the configuration mode. These settings would be saved into EEPROM on the interface chip, and be read automatically thereafter on power-up. The aim here is to add some form of setup for the user in a way which will never interfere with the funtion of the interface.

RE: Firmware/software development progress
The interface firmware/software is now coded and functional. It is completely transparant, and once plugged in the PS2 mouse just works as you'd expect, in that you can leave the computer for 24 hours and come straight back to it and it's working. The interface has so far been tested on an Atari STFM and a Mega STE/TT style keyboard. All STs right across the range use the same keyboard controller chip so no issues are percieved from STF thru to TT.

RE: Hardware development progress
There are no external supporting electronic components whatsoever, just the interface chip. This is deliberate, to cut down on quality issues. As Capt. Scott of the Enterprise said, "The more you overwork the plumbing, the easier it is to block up the drains."

OK, that about wraps it up here really. The next stage at our end is to have the PCB's manufactured and put a few together ready for sale, direct PayPal will be the chosen method of payment, eBay may be used but some reservations about that. In retro tradition, it is planned for an A4 flyer/thing to be put together describing it. Planned cost is about �15 for the complete interface. OEM sources of MS optical mice (the red LED ones) have been found, with the price tag being about �15 for one of those also, being careful with those actually so not to rip anyone off although the street price is some �25! which I do feel is a total rip off given that you're paying for packaging that's going straight into the bin. So, no packaging, just the wrapping they come in.

As for the next project, we're open to suggestions. A simple Atari - CF card interface is being discussed although some difficultly in sourcing the low-level interfacing, have to understand it first. The plan with that would be a small box that plugs straight into the AHDI port and draws it's power from the signal lines, only just possible perhaps, but hoping as the mA consumption would be so low. No further discussion on that however as that red-herring has been thrashed out over and over again on the forums with no results.

Aly, and Chris/Exxos, speaking for you here Chris ;-)

Hi Adam,

> > I need this for using long filenames in the Atari emulator TOSBOX
running on
> > MS Win 98.
> > Any help is greatly appreciated.
> Tosbox is nice, but outdated. Use Aranym instead.
TOSBOX with access to long filenames would be sufficient for me at first. It
is far more compatible than aranym and with TOS206 it runs faster than
aranym with TOS404. With fvdi aranym performs better, but then even less
Atari Apps run.
I also find TOSBOX more interesting because I've created an Atari Boot disk
for x86 PC's with the free Caldera DOS, TOSBOX, a TOS Imagefile and some
Atari system essentials and would like to continue development of this Boot
disk.

regards, Ludwig

Ok. But long filenames are impossible with TOSBOX.

Maybe, just maybe, due to differences and since u are far away, and bombed with own views, u need a view from a side (here we step in) and thats why generaly u hear complains from our side... BTW, i live far from U.K.

> I do have a problem when it is done in my thread.

> business.
> UNDERSTAND?

Whohoo! CAPS! Btw, this is ridicilous: This is public forum and topics as well are public. So, u propose that each time some on has a remark on something (as we did on prices) new thread is opened. And then if someone will have remark on something in new thread, new will need to be open? ;)

> Or do you feel you have the right to go into anyones posting, Web Page,
> or Place of Business and do that?

Hey, ones can invade contries and other can not even comment postings in c.s.a.s ;) Be sure, that if i will sell item for XXX$ and u would say it is expensive i will not get upset and even try to excuse that as invading into my thread... But to be honest im long on scene, like Atari stuffs and most i either get or give via exchanging or VERY cheap policy, esp in those times where we are little, we need to take care about community. Personal goals are, imho, less important. That is the "scene spirit", not giving away goods at big prices "as i like to offer them to fellow Atarians instead eBay". U say u like good deal, we all do, sell on eBay, no problems...

>> No need pushing, simply pointing out is enough...
>
> You seem to be a expert at that.

U posted, we comented, u went berserk. Think about that. U used political sign, u started to go inpolite. Think about that too. I guess we poked in right spot.

Janez

On my spectre GCR page I have a list of programs that I have tested. The Spectre could only run System 6.08 (as high as that is) and the serial port worked perfectly with like Z-Term and ones like that.

I never had much luck with the System 6 version of FreePPP or the system 6 internet browser. Sadly Spectre seems to only work about 80% with most System 6 stuff. What is funny is that SoftPC for System 6 actally worked, and so did the Apple II emulator. :)

Playing Spectre on a Spectre was always fun. :)

I've got a totally random thought (generator) going here...why don't we all just drop this. Its not like its us vs them, after all we're all Atarians here - its what draws us together.

Thanks everyone! :-)

I can agree with that. I have a PDF book I downloaded and Porthos shows the text fine, but not the graphics. ZView shows everything and works great. Most PDF's work fine except for the ones I get from my local Atari club. For some reason the some letters are missing and I get garbled text. It is the same under Genva. Trying to figure out what the problem is.

That's not the point! Rudolphe AFAIK never wrote, that someone hasn't
the right to come into his thread/advertisement and say what he think
about his proposal - that's the difference!

> If what you are saying is true, then anyone can hack into a Business
> Web Page and say Hey you can get it cheaper at XXXX.

UseNet != Business Web Page

> But do it in your own Thread. Not mine!

You've no own thread - if you want your own thread: use WWW!

> I don't have a problem with any people as a whole, I am not that way. I
> do not like someone who trys to devalue my stuff in my Face.

That's suggested: you've only problems with any kind of people as far
as they don't agree with you, isn't it?

I was going to comment on this thread until I read the whole way through
it and realized I have no idea who I agree with more. It's all just crazy...

Thanks,
Mark

But if some one did, it is dis-respectful. And I would think that
Rudolphe
would not like it.
>
>> If what you are saying is true, then anyone can hack into a Business

Never said that. This has to do with having respect and being
a decent responsible USENET user.

>
>> But do it in your own Thread. Not mine!
>
> You've no own thread - if you want your own thread: use WWW!

No, I don't own my own thread. Never said that. But it was just
a advertisement. If you or anyone did not like the price then
at least thats all that should have been said. And if there is
anywhere were it could have been gotten cheaper it should
have been posted.

Instead, I was insulted. Which anyone has the right to do.
But it shows everyone reading this thread what kind of
person you are.
I know that I will never buy anything from or have anything to do with
the
people who started this. And the ones that keep it going.
Which probably will not hurt anyone in the least. But remember
this. When you post here, Expect the same treatment that you
have shown to me.
>
>> I don't have a problem with any people as a whole, I am not that way.

> That's suggested: you've only problems with any kind of people as far
> as they don't agree with you, isn't it?

If I came into your posting and insulted you in this newsgroup would
this not upset you?

Still there is no mention on where the item I had for sale can be
gotten at a cheaper price.

Instead, there were just some people who wanted to start a Flame War
and thats what they got.

I have nothing more to say about it. Insult me all you want. If thats
what
makes you guys happy.

But it goes both ways and it will.

Xref: g2news1.google.com comp.sys.atari.st:2948

Well guys, I'm beginning to believe that I'm incompatible with TOS
computers anymore. :-(

I've been having some problems with backing up data from my BBS (one burn
works, 2 don't, 1 won't, 3 will, etc,etc,.) via a SCSI Plextor CDR. So I
decided that I would upgrade from HDDriver 7.0 to 8.1. (I'm already using
the latest version of Anodynes' excellent ExtenDOS software).I figured it

was time to upgrade anyways.

So from a running system, I deleted everything in the HDDriver folder on C:, then copied in everything v8.1. I then ran the utils app. It ran. I located hddriver.sys. It complained that it was an older incompatible version. So I used the install option. This seemed to work, it just gave me a message afterwards that I needed to reset all my options afterwards.

So. I looked at my settings. The device check found all 3 of my devices on the SCSI chain. However, it would not find any partitions. Or let me pick anything that would let me look at them.

Somewhere from in the foggy mists of my mind, I seemed to recall that at some point you have to reboot with HDDriver to get everything going. So I did that. Ooops. No go. The bootups says this:

```
HDDriver info
No Partitions Found
Some amount of memory allocated
```

and a lo-res TOS desktop with an A, B and trash icon. Thats all. Installing a C icon and clicking on it only gives a "no such partition" error.

Note that this was *without* the HDDriver floppy inserted - so it had to have run from the hard drive, right? Tell me I'm not crazy on this point.

Anyways, so I inserted the HDDRiver v8.1 floppy, rebooted, and I get the same message as above. No partitions found, blah, blah, blah. So I run the HDDriver utils app from the floppy drive. It runs. I pick the scan for devices option. It reports this:

```
Device check:
Bus 0: Atari ACSI
 01.00: Seagate ST 34555N 0930 Direct Access
 02.00: Plextor CD-R PX-R412C 1.07 CDROM/Recorder/DVD (approx)
 03:00: SyQuest EZ135s 1.17 Direct Access
```

So it finds the hardware. I then try formatting (just for testing purposes, I really, really don't want to reformat or re-partition), partitioning, trying to locate HDDriver.sys, nothing. No selector boxes ever shows C as active, its always greyed out.

Some specs., its a Mega ST4, TOS 1.4, 4 gig seagate HD, Plextor CDR, Syquest EZ135 cart drive, and it was all a solid, no errors running system with HDDriver v7.0.

I used this same v8.1 floppy disk to install HDDriver on my Falcon, but I don't remember having these problems at all, except for having to reboot at some time to get it to show up the partitions.

So. I'm stuck without a Mega ST to run my BBS. Can someone tell me how to get HDDriver to find my setup again? How to do this without losing approx.

4 gigs of data from my BBS? Tell me what I did wrong so I won't do it
again (I promise!). :-)

Thanks everyone.

When you reboot the machine, its probably booting the boot sector from the hard drive first rather than the floppy's auto program (I cant be sure with the mega, never had one). If so, then its loading hddriver 7 off the HD bootsector, then loading the auto folder version of hddriver 8.
Try holding down the CTRL key to force the computer to skip booting *ANY* devices, then once you get to GEM, insert HDDRIVER V8 floppy, browse to auto folder and run hddriver.prg. Next run hddrutil.app and do an install driver or what ever it is, I cant remember, then reboot mega without the floppy.

If this doesnt work, im sure Uwe will be able to help you further.

BTW. A little tip:
Whenever upgrading one version to another *NEVER* delete anything. In this case you should have renamed the folder to HDDRIVER.7 or something.

Coda.

Not as far as I can tell.  Google '"dave small" atari'.  The second link
was "Where are they now?"  The server for that link was down;
archive.org says it was last updated in April 2004.

That page
<http://web.archive.org/web/20040405210412/http://www.toyz.org/mrblog/archives/
00000115.html>

points to an AtariAge forum thread from 2001.
<http://www.atariage.com/forums/viewtopic.php?t=9183&highlight=spectre+gcr>

Found an AOL page with a photo, but I have no idea how recent that is.
<http://hometown.aol.com/davetracer/index.html>

The AOL page doesn't mention Atari at all, but it came from his AtariAge
user profile.

Well, I didn't simply delete it, I used "install" to overwrite the old
version. Which I guess, amounts to the same thing <grin>.

Anyways, its fixed now. See my reply to coda for full details but it was
along the lines of what you were both saying, AFAICT.

Thanks ever so much! :-)

That seems to be correct, AFAICT. Confusion between the new/old drivers
and what was running at bootup.

> Try holding down the CTRL key to force the computer to skip booting
> *ANY* devices, then once you get to GEM, insert HDDRIVER V8 floppy,

It was <alt>, no software at all, then ran hddriver.prg from the auto
folder on the floppy. It found the partitions correctly then. Then running
the utility app from the floppy, auto configure, with preserve old
partitions on, and bingo, the reboot worked fine.

> If this doesnt work, im sure Uwe will be able to help you further.

I've no doubt that the "guru" of Atari hard drives could! <smile>

One thing I've noticed though, there seems to be one small bootup diff.
from 7 to 8.15. On bootup from the hard drive, there is a 3-4 second
pause, right after the devices are displayed. Its not the floppy pause,
I've got a blank, formatted floppy in the drive. This pause was not there
under 7.0. Its probably just some odd setting or the other, I'll review
the options when I get more time later.

> BTW. A little tip:
> Whenever upgrading one version to another *NEVER* delete anything. In

Actually, while thats good advice, its not the best (wait, wait, don't get
upset!), the best advice would be for gung-ho people like me to *ASK* here
on comp.sys.atari.st FIRST so that people like you, Uwe, and Lonny can
keep me out of trouble! <big grin>

Thanks ever so much (and to the forums on Atari-age that also posted
helpful info)!!!

Do what? It flashes!! Tell me more, can't have that. Does it really?
It's working yes? Priv-mail me, bit startled by that..

Erm, only thing I can imagine is that the PS2_IS_MOUSE_CONNECTED proc is
playing up and repeatedly re-initialising it. Not entirely refined that

proc, had problems developing that one, relies on the CLOCK and DATA going low, sometimes read as highs due to the port latching over.

Tell me more...

Aly

Oh I loved Codeheads!! Especially Warp 9 and the fortune cookie program.
That was awesome!

As for Dave Small, when I wrote and put up the Spectre GCR site, Dave said he liked it, had a lot of fond memories of the Spectre, and was going to offer me the code for Spectre 3.1, but that never happened. But great talking. His daughter actually wrote me to say hi. She was now in highschool or something like that. Or maybe even college? :)

Dave Small and Codeheads... the two reasons I keep an ST around to this day.

Are you sure about the bronze??? I thought pennies were copper until
the zinc centers were put in about 1982...that is, except the 1943 steel
pennies made during WWII. I *never* heard of bronze pennies.

Whatever it was that caused your problem, please note that there should
not be any delay when booting. My guess is that you have configured SCSI
IDs or LUNs without any devices present. You should only enable those
IDs that correspond to an existing device. You can use "Auto
Configuring" for that, but you can also do it manually.

lemmie rephase it :-) "I have a mouse that can flash" , not done the test
pcb yet so not got as far as beta testing the program yet :))

Sure, and I do the same (and have done), but there is just this
crossover, I feel. If you want to do something with a computer that
no-one else really wants to do because the technology simply isn't

suitable for modern requirements, paying more for the hardware makes no sense at all. It's just obsolete hardware. I've got a house full of it, I enjoy using it, but I can still see this.

>>I moved from Falcon to Mac for music, because whilst there is a certain

Even not as a music professional - I enjoyed using the Falcon, but I wanted the better MIDI capability, and the recording. Even though the Falcon had been out of production for years, and Falcons were in fact at their cheapest, the additional hardware was still priced at insane levels for something unsupported and limited.

I'd have liked to keep using the Falcon, but it lacked the stability of the ST for crude MIDI stuff, and the cost/benefit of the advanced stuff... madness.

But, if I found a cheap Falcon with all the audio bits, I'd be using it right now, and telling people "Hey! I made this on 12 year old obsolete technology! Isn't that amazing!".

You think Falcons are retro? I do stuff with Apple IIs - my IIgs runs VNC, is a webserver, an IRC client.. and I'm waiting for the same abilities to come to the Apple //e via Contiki.

Richard

> 03:00: SyQuest EZ135s 1.17 Direct Access

If your boot drive is not device 0 but device 1 your problem most likely resulted from HDDRIVER (the one you installed on your hard disk, not the one from the floppy) not being configured to check your boot device. The default installation only checks device 0, but not 1. This means that after installing you can boot the hard disk driver (TOS does that for you) but the driver, when started by TOS, does not find the boot partition. The result is just like you described: No partitions are found and the Atari is in a state as if no hard disk were connected: Only A: and B: icons, low resolution etc.

In general I recommend using device 0 as the boot device in order to avoid problems like that. Other configurations work as well, but they need more care when configuring. The "Auto Configuring" option of hDDRUTIL is helpful in this case because it automatically finds all connected devices and adds them to HDDRIVER's device list.

Thats a tought one, depending on priorities. If you def. want to do DTP, and its the most important, the the TT with its 19" monitor and high-res is hard to beat. But...the TT is the least compatible with games. Thats not to say that there are no games for it. If you wanted to play games as the top priority, but still wanted to do some DTP, then the Mega STe has the most power with the most compatibilty. The Falcon always is a contender, IMO, for just about anything. Its more compatible than the TT, though not as compatible as the STe's, but offers greater res/colors than

the STe's, although not (stock) higher than the TTs special high-rez mode.
The Falcon is enjoying better support, IMO. I see many more wonderful
hardware announcements concerning it than the other models. Examples,
CT60/63/PCI, EtherNAT, SuperVidel, etc, etc,..

Availability is another issue - it is getting harder to find higher end
Atari's these days.

If Rodolphe Czuba manages to make the Hawk a reality, it might be another
choice to consider as well.

Just my 2 cents worth. Others, I'm sure, will weigh in with helpful and
thoughtful insights...

Well, I was watching it this morning, and it seems to be when its trying to access the EZ135 during bootup. I don't normally keep a cart actually in it. The pause starts, disk access light on the EZ is blinking (and remember this is no great amount of time, maybe 3-4 secs.) then the disk access light stops and the boot process continues on just fine.

Mark,

I agree. Some games are unplayable on a P4 3Ghz with 1GB memory. I get
about 10fps playing Radikal Biker. Way too slow...

Rory

This sounds as if the EZ takes unusually long to report that there is no
cartridge in the drive. I doubt there is anything you can do about it
(except booting with a cartridge inserted) because HDDRIVER has to wait
for the EZ to respond before proceeding.

That sounds right. The reason I left the cart out though, is that it takes even longer when it reads the cart. I'm thinking that particular cart is probably getting old/wore out.

Also, under v7.0, it did not have this wait. I 'm thinking its probably some setting or the other that I've got different.

Its not a problem either way - since its the Mega ST system that runs my BBS it only gets rebooted/shutdown-powered up about once a month, or longer (if necessary) anyways.

Legendary rock-solid Atari systems - gotta love it. <grin>

There's plenty of CrazyDots cards for sale on ebay UK or DE or some of the
other ones.  I remember I saw some sold 3 separate times consecutively.
Most auctions say they will only ship in the local country but if you
email, a lot of times they'll ship to the US.  Might be a nice step up
from the AlberTT.

Thanks,
Mark

Are you talking about this Atari port on Aranym, or the Windows port? I have the Mac version running on a basic 350MHz G3 iMac, and all games seem to run at 100% full speed with no signs of slowdown at all. Then again, I do tend to stick to the older classics, which I prefer.

Now, when I have the time for the download, and to *try* to get Mint running again, I'll be trying out the new Atari port on my CT60. I know it would probably be a bear of a program to port in this way, but I do hope it can be ported to run on a more basic Atari system instead of Unix/Mint, so that it can be run from TOS or Magic someday. Even with EasyMint, I've had such a horrible time getting things to operate correctly, I'm always forced to return to Magic and TOS, so porting for general Atari systems rather than Mint-only would be nice, when possible.

US cents (pennies is an informal term) were 95% copper and 5% zinc from 1864 until 1982. This is not bronze (an alloy of copper and tin). It might be considered brass (an alloy of copper and zinc) except that brass is generally far more than 5% zinc.

We now return you to our discussion of Atari computers.

Galen

I suspect that your delay is HDDriver looking for IDs 4, 5, 6, & 7.
You can tell HDDriver not to bother checking those.

In fact, the only problem preventing it from running under TOS is the default path setup. It looks for config files/roms in /usr/local/share/xmame and in ${HOME}/.xmame. I just have to search where these paths are setup, and add '.' (current directory) to the list of search paths.

As I said, this is a straight recompilation, to see where problems may come from (like this path problem).

Hi Patrice,

I downloaded and installed Xmame a few days ago and then found a game to
download called KasumiNinja (no idea what it is).

Running Xmame chucked out the report below but the game didn't start.
I must have something wrong.

I placed the zip file in a folder /usr/local/share/xmame/roms

Peter

Okay, I've got a Mega ST4, Plextor SCSI CDR, 1-2x burning speeds, using HDDriver 8.15 and the latest Anodyne Software (CDBackup, CDiso, ExtenDOS Gold Pro).

I've made 1 successful burn so far of my C partition, and about 15 coasters. It was with Sony media. I'm still using Sony media.

The Plextor drive does correctly read all commercial CDs and CDs that I've burnt under Linux just fine, no problems at all.

The one successful burn was using CDBackup, entire partition. This means I can read it on my Atari comps, but no where else.

When I use CDBackup (entire partition or used space) or CDIso, the software completes, reports success, ejects the CDR, but I can not read the CD on my Atari, or in the case of CDIso, on my Linux boxes.

The burn light does come on during the burn process. I used 1x since this is a lower end Atari.

I bought a Philip CD cleaner and used it but it has apparently made no difference.

I've got a 2nd Yamaha SCSI CDRW burner in my Falcon case, I can pull it and will next, but before I do that, can anyone offer any advice, hints, tips or tricks?

I really don't think its the software, as I've used it just fine on my Falcon. I'm leaning towards a bad burner. What does everyone think?

Thanks gang.

Not sure how many different platforms it was released on, but there is
a Jaguar game like that. You're not trying to run a Jaguar game on Xmame
are you? <smile> Just a thought...

Have you contacted Anodyne? I'm asking this because usually when I see questions about my own software in newsgroups it's the only place where this question was asked, instead of (maybe additionally) writing me an email. Not everybody is reading newsgroups, and here (like in other newsgroups) the answer are not always right.

What happens when you try to read the cd? Does the computer flash some kind of
message? How have you gotten things setup with the programs? When I have
problems with CDBackup and CDISO, it usually has to do with termination of the
last device on my SCSI line. I just went through that.

You are correct about reading a CDBackup disc only on an Atari, but also the
drive doing the reading should be a CDRW drive and not just a CDR drive. Discs
from a CDISO backup should be able to be read by any computer.

I've found that modern CD-R discs often perform poorly at slow burning speeds. I started running into problems with a 2x Sony CD-R drive about four years ago, even though it had performed flawlessly before then. The change was quite sudden and coincided EXACTLY with the purchase of some new discs. Some brands performed better than others after that point, but the general compatibility was way down. Thus, I'd suggest you buy small quantities of new discs of any given brand or type until you've tested them thoroughly. If you can buy some old stock of older discs (maybe check eBay), you might have better luck.

Of course, this is all VERY speculative. It's entirely possible that you're running into some other problem. At the very least, though, it's worth buying a few discs of other brands as test discs.

You raise a good point there. The local stores (Wal-mart) etc, do sell 5 packs from different manufacturers, so I guess I'll mix 'n match and see if that makes a difference.

Thanks!

Well, I was gonna get input from here first, but the point you raise makes sense. I'll try some of the suggestions I've received here so far, and if nothing works, contact Roger.

Thanks!

I get a dialog box with the message "Data on disk P may be damaged, cancel
or retry".

I'll double-check my termination when I get the chance.

I've only got the Plextor for use with my Mega ST and it is a 2x CDR,
unfortunately. :-(

```

Ron,

I agree that it could be the brand of CDs you are using.

I have used Sony CDs on my Teac 55s CDR at 1x-4x speeds and
usually end up with more bad CDs than good ones.

Since I changed brands, I have noticed much better results.

Funny, even on the Atari 8-bit I remember the Sony brand of 5 1/4 disks
always gave me problems and avoided them. Have heard similar stories
from other Atari users.

I have had very good performance out of Memorex, Imation, TDK, and
FujiFilm
CDR and CDRW media on the CT2B Falcon with the Teac 55s CDR.
I have used SoundPools CD Recording software, ExtenDos Gold and CD
Writer,
but not the latest version yet as I've not upgraded, but will soon.

I have used SoundPools CD Recording software the most on the CT2B
Falcon, and
with good media and all things setup correctly I normally have at least
a 95%
success rate when burning a CD. And they work fine on the VAIO.
Of course, I use ExtenDos Gold to read the CDs on the Falcons and all my
Ataris.
It's the best IMO. Just haven't tried CD Writer that much. I think the
version I have
only does Audio CDs, Not sure on that. But I know I need to upgrade!

The most common Error I have when burning a CD is Buffer
OverRun/UnderRun on
the CT2B Falcon. But if the CD gets completed it is always good.

After I upgrade to the latest version of CD Writer/ExtenDos Gold. I'll
use it
to burn CDs more and see how it works on the 2 Yamaha's I have. One is
faster than the other. And the Teac as well.

I need to connect at least one of the Yamaha's up to one of my stock Falcons and see how things go. And try the Teac on it too, just to see what difference there is if any. I've never burned a CD on a Stock Falcon or Atari unless you count the normal Falcon mode of the CT2B. I can burn in either Turbo or normal Falcon mode. But I do think I may have a program running that causes problems when burning a CD. As I have almost 100% success, if I do a Clean Falcon Boot, by holding down the control key and running SoundPools software all alone with nothing else. No Control Panel, ACCs or anything.

Will take a while to find the program or programs as I run alot of stuff at once.

You might try disabling any un-needed software that you have running on the Mega and see if that helps as well.

I have 3 external CDRW burners on my VAIO, and the Brand of CD Media does make a difference on them. The type of Sony CD Media I had was giving me problems on the VAIO as well, but after switching to a different brand mentioned above, no real problems.

phantomm@bellsouth.net

I got it from here http://www.rom-world.com/ which I found by Googling
for
Xmame and roms so I assumed it was the right sort of file, maybe not.

Do you have any useful links to the correct rom files ?

Peter

Hi all,

We are now taking pre-orders fo the project now named "PeST".

You can order here http://www.aqtq39.dsl.pipex.com/ps2.htm

the offical page is http://www.cps-electronics.co.uk/web/PS2.htm (will
update shortly)

We need to get a number of orders before PCB's will be made at factory. We
will count the number of orders towards the end of next month 30/09/05
approx. Orders at that time will be produced.

Alison will be setting up a store on Ebay for those who wish to buy though
there. Probably benefit UK orders mostly. Alison will post more detials on
that in due course.

Documents and specs will also be posted in a few days.

Chris

Well, I was thinking thats a possibility. Even though I've had no problems
at all with these 700mb Sonys and the Plextor in my Linux box.

<snip>

> It's the best IMO. Just haven't tried CD Writer that much. I think the

Yes, the latest versions include CDBackup (Atari backup), CDaudio (burns
audio CDs) and CDiso (standard iso9660 backups that can be read by all).

I was looking at Anodynes website the other day, and it looks like he's gonna have support for DVDs soon!

> The most common Error I have when burning a CD is Buffer
> OverRun/UnderRun on
> the CT2B Falcon. But if the CD gets completed it is always good.

Hmm, see thats why I was leaning towards a bad burner. CDBackup and CDiso finish completely and both report success when they are done. I'm getting no errors of any kind during burning. However, when I put the burned copy back in, I always get the "Disk in drive P may be damaged, retry or cancel" error.

I have tried reading the disks (the iso9660 ones) in my Linux comps and they give errors there as well.

<snip>

> You might try disabling any un-needed software that you have running on
> the Mega
> and see if that helps as well.

Because I use it to run my BBS, its pretty well stripped down to only what is needed already. I can try further disabling of everything thats left though.

Thanks.

Have you tried running Diamond Edge or some other good Hard Drive
utilitie program
that will look for corrupted files and fragmentation?

If not, try and see if how the Data on Drive C looks.
The drive may need De-Fragmented or errors corrected.

Also, not sure if this has anything to do with your problem. But the
Cartridge Port's
default letter is Drive C.  And I would think it would be write
protected since its
the cartridge port.

Are you sure your Hard Drive C is booting up online?

I have never heard of drives that write protect themselves in case of an
error. That does not mean that such drives do not exist, but I would
expect to have heard of them.

Also worth to mention that we need to load files 10 times smaller as "modern" machines, so it compensate ;)

IMHO the bottleneck is called Videl. I have a 30 GB IDE disk (a Maxtor that was running in UDMA 66 mode in an old PC) and I made some tests on my FalconCT60 100/16 (no motherboard boost). It can reach 2.9 MB/s with Freemint when the Videl is switched off, it can easily be done with a

program called Turbo Veille: you press on some keys simultaneously and the screen becomes black, giving to the 68060 (or 68030) all the machine time. Before using Turbo Veille the transfert rate was only 2.5 MB/s. You can download this program here:
http://www.geocities.com/SiliconValley/Vista/6443/t_veille.zip

See you

Well, after having talk with someone with FDI interface, the support for
both clock and external output should work, so I need people to test it.

I also remember a story about him at one (admittedly at a late date in the Atari glory days, but still!) show going down the aisle giving away the spectre stuff for free to the audience.

> Good going. I was only mentioned in one issue.

Hey, got a copy of that? I'd certainly be interested in reading it! :-)

What does a STacy go for these days? I missed out buying one when they were new..

Waited too long and the store closed on me, the last atari store in the area.

It was just a one-liner stating that I was into MIDI. Not too interesting, but
I was happy just to have something in the issue.

Bet that sad memory is etched into too many of our minds... :-(

I remember when Software Alternative in Pikeville closed here. Bummer. I have to give the owner kudos though - he rode the Atari wave, got rich, saw what was coming, closed out and retired to Florida. I wish him all the best. Wouldn't mind hearing from him, just to know how he's doing. Sadly, I can't remember his name now. :-(

Hi all,

Zview BETA 6 is available.

I'm grateful to every beta-testers and would especially like to thank Sascha Uhlig for his great work on the documentation (which is better that the software itself :) and for the desktop icon.

Well, the most important news features are:

- PDF support
- Godpaint read and write
- Animated Gif
- Zoom function

Due at a G++ bug, only the FPU version are available this time :/

ZcodecLib and Zweather are also updated to match with the new codecs format.

Ciao,
Zorro

```

Could be, its been awhile since I have messed with the cart port as
Drive C.

It is interesting that Atari put this into TOS.
They must have had some idea for using the cart port for more than what
has been developed for it.

Anyone know if the Falcon and TT also have a Drive C for the cartridge
port?

```

I need a source for a few standard Falcon monitor ports. Male and
Female.

This is for a project.

I'm not talking about the VGA or RGB monitor adapters. I need the actual
ports that are standard on the Falcon.

Can these be found fairly easy from electronic shops or are these
special
ports.

If I knew what they were called, part number or something similar it
would
help.

Thanks in advance for any help.

While the Videl certantly slows things down, the biggest (smallest?)
bottleneck is the 16 bit, 16/25Mhz bus. No way around that.

Have a look at the benchmarks (ST-RAM speeds) at the URL below.
http://www.czuba-tech.com/CT60/english/benchs_eng.htm

On top of that, the IDE communication itself adds some overhead.

Still looking for a Magnavox Professional RGB Monitor that has
the LIN RGB (ST-Falcon connection), TTL RGB, VCR Button, and
RCA jacks for connecting an Atari 8-bit.

These were also made in another name or two such as Philips RGB.

I will consider a broken one with a bad tube as my tube is fine.

Contact me if ya have something that may work.

And no I'm not spending $150.00 plus at BRAVO Computers.

Thanks,
phantomm@bellsouth.net

I tried, but the sound only worked through the headphone socket. There
was no clock at all for the FDI.
Earlier (pmdoom 0.45 thread) you said that there is no way to read the
sound matrix. I have done some reading/coding and found that although
there is no XBIOS way to read the matrix, you can still read the words
at $FF8930 and 32 to determine the matrix settings. See the Atari
Compendium for further details.
While testing this I think I found a bug in Iphigenie, it doesnt set
the clock divider rate properly, which prevents the external output
through the DSP port. This may be my understanding of the program, or
the matrix itself. But I coded a little assembler that did set it
properly, and then the FDI started working OK.
Are the sources available for pmheretic 0.45? I would like to take a
look at the FDI code.

Coda.

In fact, all audio/video code is in SDL (cvs):
http://www.libsdl.org/cgi/cvsweb.cgi/SDL12/src/audio/mint/

The XBIOS code with external clock support is there:
http://www.libsdl.org/cgi/cvsweb.cgi/SDL12/src/audio/mint/SDL_mintaudio_xbios.c?
rev=1.9&content-type=text/x-cvsweb-markup

and Didier Mequignon rewrote the Devconnect() ROM function which is buggy
when setting the external clock.

That's really excellent !!

Is there an other Zorro guy that may do the same excellent work on a web
broswer that support JAVA ? ;-)

I have sent a mail to Osk 5 minutes ago about that and here his answer:

"Just tested it on the Milan with latest stuff, and it runs fine."

Maybe you use a brocken CVS version? I don't know howerver it must work
on Xaaes.

Ciao,
Zorro

I've downloaded zView from your page, Xaaes is from CVS and may be in
fac broken.

On Hades 060 with a very recent version (5 august) of XaAES Zview 0.6
seems to work very good. Browsing through a folder with 308 images
(img, jpg, gif) didn't give me any problem.

Loading a pdf file worked ok, only the text was soo small I couldn't
read the pdf.

CU

We were talking about this, so I decided to post it for all:

http://aroundcny.com/technofile/texts/davesmall91.html

By Al Fasoldt
Copyright � 1991, The Syracuse Newspapers

There was bedlam in Reston, Va., a town near Washington, two weeks ago. A man at the front of a conference room at the Sheraton was passing out free Macintoshes -- hundreds of them. It was Dave Small at his best. Small, the inventor of the plug-in device that turns ST computers into Macs, told the crowd of ST users at a computer fair that he wanted to thank them for helping make his unusual product a success. And he then reached into a large box and tossed $300 Spectre 128 emulator cartridges out to his fans. The crowd reacted like pigeons that hadn't been fed for weeks, grabbing the palm-sized devices as they sailed across the room. I was in the audience, returning with my wife, Nancy, from our honeymoon in the mountains. I didn't catch an emulator (somebody alongside me did a flanking maneuver and deflected the one that was coming my way), but I did get to see Dave Small and his miracles in action. The first, of course, is his Mac emulator. With the ST's screen size being larger than the standard Mac's, an ST-Mac is a beauty to behold. Two million STs have been sold worldwide, and thousands upon thousands of them turn themselves into Apple Macintoshes every day at the click of a mouse. The second was something he calls the SST. It's an ST that runs at 40 megahertz. It's faster in every way than Apple's most expensive Macintosh, and a lot cheaper, too. Dave Small is one reason the ST hasn't disappeared from the American market. The company that makes the ST, Atari, had nearly abandoned the U.S. market for Europe, but Small and a few others have helped keep interest alive here. It's paying off. An advanced ST, called the TT, is now available to consumers in this country, and the company is taking orders for a notebook-size ST, too. A pen-based ST notebook computer is expected out next year. The crowd in Reston gave the TTs that were being demonstrated there high marks. But they gave their biggest thanks in the cheers that went out for Dave Small.

I am lucky enough to have a Spectre with the 128k Mac Roms and software,
and manual. And a small collection of Mac Disks that work with it.

Have it setup on a small hard drive and it works well on my 1040STE.
I used it some, but never put it thru its full paces. It is stored in a
box at
the moment.

It's abit old now, but one can still do some cool stuff with it.

I never tried any of the Macs Terminal or Net software. I can't remember
if
it supports the modem port or not. It probably does.

Well, it was probably my fault. I tried to run a program on a 1040STE
that was for
High Res only. After booting I lost all power to the monitor.
The Fuse did not blow. And when connected to the power, I get a humming
and
sometimes a faint whistle. near the transformer. To me, that means some
Caps are
blown. Or another componet. But on that side, there are mostly Caps and
diodes.

If I had one with a bad tube, the power supply part along with the front
power switch
will slide out of the monitor. A Cable has to be un plugged and a ground
wire cut.
But thats about it. I plan on replacing the Caps and see if that helps,
but my time
is limited until school starts.

I also bought a like new Mag 80 RGB exactly like the PRO model but
doesn't

have the LIN RGB ST-Falcon port on the back. It has the place for it. But no
circuitry for it. Everything else is exactly the same except for the Lin RGB Port.

I Have wondered if the TTL RGB port would work on a ST-Falcon if a cable could be
made. Does anyone know?

The ports are very similar, both round, but number of Pins are different. AFAIK the TTL RGB is
for a PC RGB connection. Or maybe an Amiga connection.

I have 2 TTL RGB cables, but no ends for the ST Computer Monitor Port.
One end of the cable looks similar to a 9pin Serial port connector. The other is round and
connects to the TTL RGB Monitor Port.

The Mag Pro is a excellent monitor. Would buy a working one if price is right, or bad one
if I can make use of it. Also may trade, Have lots of Atari Stuff.

If someone knows of a similar ST-Falcon RGB monitor that will also allow an 8-bit Atari to be
connected at the same time. Let me know the make and model.

```

I recently acquired a Nova Graphics Card for a MegaSTE or TT.

I plan on putting it into my MegaSTE along with the Vortex 386SX.

I have the manual and Software Disk. It is checked by the PLUS 32.

Looking at the board, it looks like I didn't get a full board of memory chips.

Can these memory chips still be found?

```
If so, I would like to try and put sockets on the board and add the
extra
memory if this will work. Of Course this is a future project. But would
like
the info, if it can be done.

I think I have a populated 2meg board but not sure.

Anyone know what the size of the memory chips are? 256k?

     Hey folks... call Darkforces!  That is a fun all Atari place!

     Stores closing..., here in Dallas there were many stores at various
     stages.  There was te Atari Service Center... which I raided the
     dumpster... that was fun... I was like 10 at the time.  And then there was
```

the Federated store down the street where I bought and returned my first Atari 800 XL. :)

Here we had other stores that carried Atari... Best Products, Sears, K-Mart, Toys R Us... now that was fun to go to and get games from time to time.

Remember seeing the 7800 , Lynx, Jaguar... and thinking... what the heck! Isn't Atari gone?

Saw ST's in pawn shops and electronics stores, and music stores.   Thought the same thing then. :)

Seen many come and go, so I say support the ones that are with us now and then things are not completely closed down. :)

    Nope, just moved onto other pastures, making occational contact with folk
    along the way.  You live in Dallas?

even if you do that I think the 2 GAL's on the VME card need to be
upgraded. I remember the SuperNova that I have used to be a 2 meg Nova
with a Mach32. It was updated to a Mach64 with 4 megs I think and had to

have the GAL's changed. The old ones should still be around somewhere... Basically you're going to have an interesting time with that ;) You may be able to upgrade the memory but will the driver recognize it or care? Additionally, you may have an easier time finding a new ISA Mach32/64 card that has hte amount of memory you want. They're certainly able to be found even if it's somewhat complicated due to their age.

Thanks,
mark

The CGR was something else - Mac floppies in the ST drive. Some seriously clever engineering going on there!

Yeah, that�s GREAT, PDF Viewer a one of many things that made system useable
:) Especially for Atari those times.

Really good work, and of course we wait for more really great stuff :)

Hi!

We're very happy to announce that the ETHERNAT is finally finished!!! The 100Mbit ethernet part is working fine and though we have no finished driver for the USB part yet, the enumeration test by Jan Thomas shows that it will work fine once the USB stack has been written (also by Jan). For more technical details read the (soon available) news on our homepage: nature.atari.org.

Now we need to know exactly how many boards we're going to produce, because it affects the price we need to ask of you. We have done some more detailed calculations on the final price. Have a look at this:

200 orders => 120 EURO/board
150 orders => 125 EURO/board
100 orders => 138 EURO/board

Shipping costs will be added to this. The prices are including Swedish VAT (25%) and apply for all EU customers except companies that are VAT registrated in their respective countries.
For all customers outside the EU instead the following prices apply (VAT for your country will probably be added by your customs):

200 orders => 96 EURO/board
150 orders => 100 EURO/board
100 orders => 111 EURO/board

HINT: To avoid the 25% Swedish VAT within the EU, let a VAT registrated company buy all the boards for your country from us and distribute them within your country. Contact us first if you run a company and want to do this.

Swedish customers may pay us in SEK instead of EURO. More info on that later.

Now please send us an email (to "hencox at hotmail dot com" or "henrik at gildaelectronics dot se" or "torbjorn at gildaelectronics dot se") and state exactly how many boards you want. Please don't write anything else, this is not yet your order! And we want this email even from our closer friends in the atari community, because we can't be sure that you want a board just because we know you...

We know that we've already asked for your interest in this product several months ago, but we need to get a fresh picture now.

Because Rodolphe Czuba has experienced that 10-20% of all who state that they will buy a board never goes through with it, please be honest when you write this email.

You have two weeks to register your interest (until August 23rd 2005). After that we'll post information on how to prepay us for the boards.

Regards
Henrik and Torbj�rn

> need glasses now..

You can measure only with multimeter these +5V on romport
That dumb fuse had no display

(Solder an resistor of 350ohm and a LED after fuse) ;)
(Cheap display) :)

Check out pin 1 + 2 on romport, both should have +5 Volt
pin 38 + 40 are GND both

If your romport card won�t work after replace this fuse, ask the developer to check the timing to access this card. My CT2 won�t also accept the romport interface from elmar hilgart.

Elmar modified the software card driver so this interface work with CT2 falcon.

This is a termination problem, and the hard drive might cause it. The

SCSI specification says that a drive that is switched off must not cause any problems with the SCSI bus. With your drive this appears to be different.

One solution may be to set TERMPWR OFF on that hard drive and find an external Passive Terminator to go on the end of the cable instead.

Coda.

I will dig out the falcon registers latter and write a small prog to disable the blitter, see if that improves my luck..

An ST image is not compressed, its just a straight image of the disk, sector by sector. You may be able to mount it as a loopback msdos format floppy disk on linux. I havent tried this myself though. FYI You can use dd to write the image back to a 720k floppy (if you have any).

Coda.

Coda, many thanks!

I did not try exactly what you suggested, but your hints were very helpful in finding the following solution:
I created a (new, blank) 720k standard (IBM) floppy disk image with WinImage, which works very well with wine on linux, put the files I need in it (also with WinImage), saved the image file, renamed the file extension to .ST and "mounted" it in hatari. Works perfectly!
Thanks also for the hint to use dd to write ST images back to physical disks. I will try that later.

Thanks again,

Chris

IIRC, the standard says "should" and not "must" - most devices behave fine
when powered off, but I have seen at least two that reproducibly cause
trouble when powered off - one was the ST296N harddisk, and I do not
remember which the second was.

Is there any Atari app that will decode rar files - preferably in
TOS or MagiC and not MiNT?

Regards, /Peter/

Version 3.60 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit and 32-bit Atari computers. Developers' goal is to maintain TeraDesk as a small, simple, fast and reliable desktop, which can run on any TOS-compatible Atari computer, clone or emulator and which can be be functional and competetive in the modern multitasking environments and all flavours and versions of TOS-compatible operating system(s), while keeping, as much as reasonable, familiarity with the original TOS desktop.

Several new features have been added since the last published version, mostly in the areas of handling file attributes and access rights, and manipulation of desktop and window icons. Also, some bugs have been fixed.

Users are advised to read the documentation before running the program ;)
Some features of TeraDesk may not be immediately obvious.

Have fun.

If you were not registered for a new CTCM production, you can yet order one.

But now you have directly to pay.

See my web site for price and shipping cost.

you can pay :
- cash (euro) in a letter.
- paypal (add 4% to cover paypal fees).

Thank You

Hello all,

We are pleased to announce that the site is online
now! Hope you find something of interest there and any
feedback would be appreciated.

We still have plenty to add to the site but this will
take time!

Try not to break it LOL

http://stos.atari.st/

Cheers,
Lee

I love reading what that man wrote. He also wrote a short story that was published in Current Notes, I thought it was awesome.

Wish I had all of the Current Notes mags I used to have. They got lost/destroyed over time, and man....I miss them them, all of them, now.

:-(

PS Heck, you know, I even wrote 2 articles for Current Notes. :-)

Hi Rob,

> We tried to get a development system to port MiNT. Genesi promised a
> development system. They asked for the address to send the system, they
> NEVER sent one.

If you speak about development system you speak about not pay the full price? As far as i remember, the computer based on the pegasos board was planed as an amiga clone. If i look at the homepage of genesi, the computer based on the Pegasos II board was offered as a linux pc and MorphOS was also running. I have the feeling that the market was a little bit to small. Maybe genesi think, they cant sell enough systems as Atari clones to get the money back they spend in a development system?

Can you give me some information about you plans to porting MiNT? It looks like a different approach to get a Atari system running than my idea. For the first step a had different ideas to save development time.

> The Pegasos was in our minds the best option to get new hardware.
> ...

Thats the reason why i prefer to use an existing board. But in better english :-) And the Pegasos II still exists, developing new hardware will also need time. You had to wait again years (look at the coldfire) to get a PPC board.

I have send a email to bplan. Maybe it is more easy to talk with bplan.
But i am afraid that i have to by my development board. But i can save
transportation costs because bplan is only 25 km away from my home :-)

Regards
Michael

Hi,

> Can you actually *buy* a Pegasos board now though? I heard that they
> are so hard to get hold of.

I dont know because i never tried to get one. But i have send a email to
bplan and ask if it is available for customer and i aksed for the prices.
If i get a answer i will post the news. I think, bplan as the developer
and manufactor of the board is a better address for this question.

Regards
Michael

Hi,

I own a 4mb Mega STe running 2.06 TOS.

However my hard drive (a Seagate ST32155N 2.1gb) connected to the ASCI port fails to boot now.The drive was formatted with HDDriver v8.0.

The drive does 'whir' up on power up but does not boot. The HDDriver
software finds the ASCI device but no Hard Drive.

Firstly.. is the hard drive beyond saving ?

Secondly is there anyway of recovering the data using a PC ?

Cheers
Phil

You didnt say which SCSI interface youre using. Maybe its this which is
dead and not the drive? Have you any other SCSI devices you can put on
the bus to see if they work/recognise?

If finds the device, but no drive? Can you elaborate? Do you mean that
something like "ACSI 0.0" is reported, but the drive name is missing?

> Firstly.. is the hard drive beyond saving ?

Do I understand it correctly that this drive worked before, and even
though you did not change anything regarding your hardware setup it does
not work anymore? If this is the case it sounds bad. But maybe it's just
a broken cable. If the device is recognized, but the name (only a few
bytes) cannot be transferred a broken cable can easily cause that.

> Secondly is there anyway of recovering the data using a PC ?

I doubt it, actually my experience is that it is even more difficult to
recover anything with a PC because the more low level access is required
the less you can do it with a PC. If a device does not report its name
anymore there is something fundamentally wrong.
But nevertheless it's worth a try: A PC running Linux should be able to
access the TOS-compatible partitions of this drive if they can be
accessed at all.
Ensure that under no circumstance anything is written to this drive. If
data are garbled while being transferred trying to write something will
make things even worse.

Hello,

Now I ported all what I did from Doom to Heretic. However, in this version, support for external clock on Falcon is broken as I tried to add support for FDI interface (both clocks and output).

When I click on Device check it says "Bus 0: Atari ACSI". But if I try
Format it doesn't list any devices.
The drive worked until yesterday. I then installed a new Power Supply Unit
(Atari's own) into my MSTe.
As I mentioned, the drive does power up ok.

PHil

In this case it simply must have something to do with changing the power
supply. Either the new power supply does not work correctly or something
was broken when installing it.

thanks Uwe and Coda

For the past 6 hrs I thought i'd lost everything!!

Anyway I found the problem.... a jumper had fallen off my HD (parity disabled) whilst I was installing my PSU... dohh!

Ok.. now for a Parcp full backup!!

Phil

While on the subject of Mega STE Internal Hard Drive,

I've a few questions.

I have a Mega STE TOS 2.06, 4megs High Density Floppy Drive and
Internal Hard Drive using the Factory hard drive hardware.

Actually, due to lack of space at the moment, I've not used it that much
and is
in storage. But I plan on setting it up as I move stuff around.

My questions are these.

Will the internal Factory Hard drive hardware support more than one SCSI hard drive, if I can make room inside the case? Using HD Driver?

If so, what starting version would be ok to run it like this?

(Reason I ask, my original new version of HD Driver seems to be damaged)
(I've never used it or installed it before) Going to check it on another system
to make sure that it isn't my floppy drive.

And, can I run 2 scsi drives on the Factory hardware and also use a few more
drives like another SCSI, CDROM/CDRW using a ICD Link II or a Link 97?
(I have both devices.) on the DMA port?

Since I have a Vortex 386SX board installed, I'd like to use it with DOS on a small
SCSI on the Factory hardware. And have another SCSI drive just for TOS stuff.
Possibily choosing which drive to boot from on start up if possible. If not, it isn't
a big problem. I've the manual to guide me on setup.

I want to experiment with Terminal Programs on the 386SX such as Net-Tamer
and a few others, and since the MegaSTE has 2-3 modem ports it will be
fun for me to see what I can get running on those ports.
I have a CD here called (So Much Modem Madness 2) with over 6000
programs, mostly in DOS stuff. I've had it for along time and would like to
see what I can find that will work.

However, I have wondered if HD Driver does increase the size of the DOS Boot
partition, and DOS partitions with PC hardware emulators like the Vortex 386SX
and the FalconSpeed 286 board. As the boot partitions are abit small.
However, with FalconSpeed you can access fairly large partitions even Tos ones
if memory serves me correctly. But I've not much experience with the 386SX Vortex
yet.

Another question thats probably be asked alot, but I can't remember the answer.

On A MegaSTE with Factory High Density Floppy Drive, If I connect a second floppy
drive, whether it is a DS/DD or a 1.44 High Density Drive. Will the MegaSTE setup for
the right drive, or do I need to change a setting in either software or
inside with a switch?

Can I just plug in any drive such as a 5 1/4 Floppy 720K IB Drive, DS/DD

or High Density
and the MegaSTE will know whats connected? (I hope this is the way it
works).

I know HD Driver is Good. However I have the original English MegaSTE
system Disk and
Atari Advanced Hard Drive software for the MegaSTE.

I have heard that the internal hard drive hardware can be touchy. So
should I use the Atari
hard drive software thats was for the MegaSTE hard drive or go with a
version of HD Driver?

Another question, Is the MegaSTE limited to 19200 Baud or can one use
HSMODEM7 to get
better speed out of all the modem/serial ports?

And if HSMODEM will work, is this only program available to gain those
extra speeds?

It has been awhile since I setup a good Atari from scratch. So I need a
little refresher on
these things.

Any help is most appreciated.

BTW, Any one have a very clean working MEGA STE keyboard for trade?
My MSTE looks like new, but the keyboard is abit yellowed.
Contact me if ya do.

Thanks,
phantomm@bellsouth.net

No, it won't. You need another host adapter for this.

Registered users of course get a free replacement by email if their binaries are damaged.

> And, can I run 2 scsi drives on the Factory hardware and also use a few
> more
> drives like another SCSI, CDROM/CDRW using a ICD Link II or a Link 97?

Yes, you can use up to 7 devices with the Link97, but you have to ensure that the cables are short if you actually want to connect so many.

> Possibily choosing which drive to boot from on start up if possible. If

The HDDRIVER manual contains information on how to boot from different partitions.

> However, I have wondered if HD Driver does increase the size of the DOS
> Boot
> partition, and DOS partitions with PC hardware emulators like the Vortex
> 386SX

With HDDRIVER the TOS (!) boot partition may be as big as any other partition, but HDDRIVER cannot lift any restrictions your PC emulation may have.

> Another question thats probably be asked alot, but I can't remember the
> answer.

There are search machines for newsgroup searches. Actually a lot of the questions asked here have been asked and answered many times in the past ;-).

> I have heard that the internal hard drive hardware can be touchy. So

The internal drive is a hard disk drive like any other. There's nothing special with it.

```

Thanks for the info Uwe,

I originally bought HD Driver 6 New, Still have the original card and
serial number.

I bought a german version of HD Driver v. 8.04, Have original disk and
manual with
serial number on disk label.

If I e-mail you the serial numbers, will that be enough to get a version
8.04 thru e-mail?

I could scan the original version 6 card and send it, or just e-mail, my
name, address and
etc along with both serial numbers.

David Small is agreat guy and speaker. I saw him once give a talk at an Atari
show in the Detroit area some years back. Even my wife enjoyed his talk and
she basically is not an Atari fan.

>Wish I had all of the Current Notes mags I used to have. They got
>lost/destroyed over time, and man....I miss them them, all of them, now.
>

Yeah I only have two copies.

>PS Heck, you know, I even wrote 2 articles for Current Notes. :-)

Good going. I was only mentioned in one issue.

I have HDDriver 8+ but that only protects the root and boot sectors and it won't even do that because it's saying that drive C is write protected. Can't find any other setting to fix the problem. I'm on an STe with TOS 2.06 and 4mb ram.

Hello,

On my FalCT60 100/20 MHz, with an IDE HD capable of 100 MB/s transfer
rate and a CD burner capable of 7.2 MB/s, with HD-Driver 8.13, the
actual transfer rate is only of 2.5 MB/s, though the rate displayed
during boot is 6.3 MB/s (CT60 utility rev. 1.03a from march 2005).
Is my Falcon faulty ? or, do they all behave the same way ?

Thanks,

Jean-Luc

I think this can happen due to disk errors. It depends if the disk has the S.M.A.R.T stuff or not. Someone else might be able to confirm it. I know if Linux (I know, a bit higher level) detects errors it immediately remounts the filesystem read-only. What's to stop disk manufacturers from doing this low level on critical errors, in order to protect the integrity of the data.

Thanks,
Mark

I'm off but it's a long drive. Exactly how big of an event is this? I'm
not going to come if it'll be quite small. I would consider going just to
meet lp, Carey Christenson and you Edward ;)

Thanks,
Mark

I think mine does something similar to this. I tested real write operation with filesystem overhead and everything and it too was somewhere around 2.5MB/sec. Perhaps there's a bottleneck inside freemint or TOS? I'd love faster disk throughput. A real 15-20MB/sec would be a dream.

Thanks,
Mark

I have a few issues of Current Notes, but not the ones you need.

I remember Dave sending them to me free along with some 8-bit software that was fairly new at the time. I exchanged a few letters with him and he has a great knowledge of Atari.

It would be nice to see Current Notes up on the Web or at least Daves' stuff.

Also, gotta mention Ben Poehland The 8-bit Alchemist!

Okies, ta.

I'm going to write all this stuff up about the MSTE as I gather the information then post it out there somewhere.

Would anyone have a zipped or .ST image of the English MSTE Language Disk? Have found lots of German MSTE images out there but only standard English ST/Mega disks.

Am guessing that the CONTROL.CPX / .ACC is updated for the 16Mhz function etc. Have the German one..

Thanks :-)

Aly

Patrice.

CT060@80mhz/25mhz, 64/16mb Tested doom.wad and doom2.wad

Under single TOS: (clean boot, nothing loaded)

Runs about 1 frame a second. Sound effects works fine. No music (is there supposed to be?)

Under MiNT: (Freemint 1-16-1, XAAES, Thing, nothing else)

Runs about 10 frames a second. Sound is horribly screwed up. I guess the same as what other people reported with 0.44. This isnt an inverse sample problem, its like the sound matrix isnt set properly, or the wrong clock is driving the DAC.

Points:
1. Im going to try mobo @16mhz, but I have to put the 25/16mhz mobo boost to a switch on the front panel first.
2. Im guessing that your command line options dont match the original doom, as -nosound and -nomusic dont do anything. If so can you post a list of options?
3. On default I usually have Iphiginie running to set the matrix so that my sound goes out through the FDI/SPDIF instead of the headphone soicke. I notice that when doom starts it initialises the sound system and removes the clock to the FDI. Any way of keeping the FDI output while setting the sound as normal?
4. Rename doom.ttp to doom.prg and it runs at least twice as fast...?!?!
5. Press F1 for the help screen. Another key to get to the second screen. Dies with the message: "W_GetNumForName: HELP2 not found!". This may mean that my .wad is corrupted. Can someone else check this out?
6. Under MiNT the average load while doom was running was only ~30%

The ones I use are:

chapelie.rma.ac.be

ftp.lip6.fr

atari.xs4all.nl

They are all active. They are some other, but these are the ones I use the most.

Exxos: Already there ;-) Just trying to decide what little thank you-prezzie I'm going to put in the jiffy bag.

Ah, now totally fluent in Atari German ;-) Have partitioned and formatted the disk now with AHDI 5.0, tried to patch it with the effect being that it won't do a thing without a floppy disk in it, so reverted on the patch. May do 6.05 tomorrow to see how that behaves.

Thing that confuses me is that if a floppy disk is present it HD boots immiediately, take the disk out and it adds another 5-10 secs before it'll recongnise the space-bar being pressed and then the FDD light stays on continually until a disk is inserted. Should it do that? The only HD related visible file I have on the HDD is SHDRIVER.SYS in the root, removed AHDI.PRG which was in the AUTO folder as it was loading twice, so guess that's install already in the boot sector. As already mentioned, if I patch AHDI with HD_PATCH then it stops recognising the HD as a logical drive.

Have read the experiences of others on the various forums so trying not to duplicate here, their problems seem to centre around HD upgrades and formatting alone.

Lots to write up.

Will boot from floppy if Ctrl-Alt-Del is pressed, then ALT for a short while until it picks up the boot sector with ALT still being held, else gets halfway through the FDD boot and reverts to the HD boot. Can't get it to do it from power-on ALT or reset ALT though. Takes a bit of getting used to to get it right, bit of a black art this MSTE floppy booting.

Aly :-)

Okay, (I'm trying to make sure I've got all this straight! :-))
if you have all software disabled, then it still crashes?
If so, its something besides software, I would surely think. What kind of
memory do you have installed? Both ST and fastram. I had heard that
certain 4-14 meg ST ram upgrade cards don't work, and that lower quality
SDRAM doesn't work. Also, I've been told that a lower quality power supply
can cause erratic problems. In addition, have you got a good heatsink/fan
on your 060 CPU?

>You forget that I sold 330 CT1 and 242 CT2 accelerators before !
>Some people do not need more than CT2 or CT1...

This is an argument. I have three Falcons for example.

The first one is unmodified (and will always be, just for compatibility reasons).
The second one has (of course) a CT60.
The third one has an Afterburner and a NOVA graphics card and I use it on a daily basis as long as there is no acceptable graphics solution for my CT60 falcon.

>I sold CT60 to people that have not a CT2 except 1 or 2 people...
>But how CT1 + CT2 are yet in use..??
>Where are these falcons ? Hey so many people are looking for them...it
>may be good to locate some not used falcon !
>No falcon on ebay....
>Very strange...

I also know a lot of people that still use their Falcons and have more that 1 machine.

So if you assume that there are 6000 Falcons still in use and 1/3 is nearly unmodified, 1/3 is already equipped with a decent accelerator there is 1/3 (or 2000) potential CT60/63 buyers. This means that Rodolphe already has reached more than 10% of them. That is quite a good rate I think.

Do you agree?

Regards,

Frank

As to point 2 above I really should have read the README first!

Doom now works in TOS with a just about playable frame rate. All I have done is updated the CT60 from 1.02b to 1.03c. Im not sure if that is enough in itself to fix the problem. I may go back to 1.02b to test the theory.

BTW, I just have the doom.wad and doom.ttp (renamed doom.prg) in the directory. There wasnt a CFG file until after I had run doom in MiNT several times. Until the CFG file was created Doom didnt run at all. Should I have taken this from the PC's Doom folder?

Coda.

> Okay, (I'm trying to make sure I've got all this straight! :-))
> if you have all software disabled, then it still crashes?

yup, though it does not do it all the time, I would say its like a thermal fault, but it seems to work better when its been left on a bit, though not by much.

> If so, its something besides software, I would surely think. What kind of
> memory do you have installed? B

Its crucial 133 CL2, I tried another stick though CT60 didnt find it so assume its too slow for it.

oth ST and fastram. I had heard that

> certain 4-14 meg ST ram upgrade cards don't work,

I have a ram card, ive tried 4MB and 16MB, can't remember what kind, EDO I think, I tested that out with my fav ram tester for a hour and that passed perfectly (this was why I was asking about TT ram testers)

and that lower quality

> SDRAM doesn't work. Also, I've been told that a lower quality power supply
> can cause erratic problems. In addition, have you got a good heatsink/fan
> on your 060 CPU?

yup, the one which came with the CT60... with fan it idles at 38deg I think it was, without fan 42deg.

PSU ive changed several times, all different makes and models.

When I do boot auto folder programs, it will say work a few times then refuse to boot, then it will work a few times again.....

Something is tripping up somewhere, I thought the IDE drive was to slow and caused problems, but im using SCSI now and still the same.

CT60 seems to run a lot better with SDRAM disabled, those crashes I uploaded were just booting or changing video mode, I dont get such crashes with SDRAM disabled...... Though the other problem is I can't get STOS to boot in CT60 mode and it used to work, works fine in 030 mode. I think the STOS falcon extensions I use init the falcon bus on booting which is causing the crash.

I would relaly like to get CT60 working with STOS Falcon extensions, though I get nowhere near as far as investigating why it crashes.... no point since I have all these other serious problems first to contend with... I suppose I could write a small prog in STOS for the auto folder to disable the blitter to see if that helps...

Cheers,
Chris

Hello, all!

STinGadel has made some fine, fine progress. The Beta test has gone quite splendidly, and the telnet service has been as stable as I could have asked for.

It is now configurable to any listener port (defaulting to 23). I've implemented most of the old Citadel BBS commands and features.

If you're interested in logging directly into an Atari ST, right through the internet, telnet into 'bbs.coldwinterknights.net' for the beta test of STinGadel, also known as Cold Winter Knights BBS.

For continuous progress updated, watch the website

http://www.coldwinterknights.net

I've got a few more features I want to add to it before I feel comfortable releasing any versions, but it shouldn't be too long, now.

```

I can confirm the speed increase both in tos and in Mint if I rename doom.ttp to doom.prg. I think the speed increase in tos has nothing to do with the update to 1.03c.
If I run doom.PRG in MiNT, the sound seems to be more distorted (if it can be ;)) But in TOS the sound is excellent. Really.

Hi Ed,

All work for me except for the atari.xs4all.nl

I've tried typing it in just as above but get a bad page.

If I use FTP:// in front of it, I get to the site, but get disconnected

with a message
saying that I don't have permission to access the folder.

Is this a anonymous FTP site?

And or is there things like a password needed to access?

Maybe a different port number or something?

phantomm@bellsouth.net

Anyone else have a Hybrid Arts SMPTE Mate Plus?

I need some info on this piece of hardware, just got it recently.

Have no Manual for it, which I really could use.

I know Hybrid did alot of MIDI software and about Tims Atari Midi Site.

Looking for info on what this is capable of.

I Googled for info, but couldn't find anything specific.

Did any software come with this hardware?

Also is this device Falcon compatible?

Any info is appreciated,

people normally stuff the jiffy full of greenies, and I dont mean bogies
either, lol...

and anyway you cant use a cap E in exxos you loose that nice "all the
letters are the same size" kinda thing plus the nice curves...... im a guy,
I like to see curves ;-)

Chris :)

It does that so if some one fetchs the password file its useless. You still type "password" as the password. It then runs it through the same routine as it used when you did a generate password, gets "348th348t9ph34p89htq34tpp234h34hqr9w" and bingo you are in

failing to understand, if the passwords are in the "password file" and that is now not the actual password, so *where* are the "actual" passwords stored ? they have to be stored somewhere if not in that file then how does the program know what the passwords are ? it does not make sence.

I think you ment it encrypts them!

anyhows, I just dragged the FTPUSER onto the APP and the bloody thing it logging on now!!!!!!!!!!

god knows why, the generate passwords altered my file so it found it, something screwed somewhere, gonna get cracking now :)

The  Atari GENERAL.CPX is the same for all computers. It detects which
machine it is running on and displays the appropriate options. On the
MSTe it will switch clock speed and enable/disable the cache. On the
TT the cache enable/disable is available. On the Falcon or ST(e)
neither option appears.

I have the language disk if you want a copy.

Hi Coda

Nope, not used that for some time, it cant keep up the pace with this PC I'm
afraid. Without Outlook my life would grind to a halt!

Hey Steve,

What News reader/e-mail program did you use on the PAK'd MSTE?

   Hi,

   100kb/sec i not that fast, i have average arround 250-300kb/s with peaks
over 400kb/s on CT60 and average od arround 180kb/s on CT2. It is Falcon +
ethernec + assemsoft ethernec drivers + MiNT OS.

  Janez

Okay, I'll bite. What does Outlook do, that other software can't?

Thanks.

I'm planning to design and produce a PCI adaptor for CT60/63...

For that I need at least 100 pre-orders... the list of pre-orders is open up to september, the 30th of 2005 !
At september 30th, if there is not 100 boards on my list, the project is definitively cancelled or I will check to increase the price of the board !

You can see what will be this adaptor here :
http://www.czuba-tech.com/ct60/CTPCI.GIF

- It is a small card that plugs on the CT60/63 bus and uses a PLX 9054 LOCAL-PCI bridge.
This modern bridge is the successor of the 9080 that was used in the Milan. It is register backward compatible...
- Because some of you have ATX tower case, they will want to use the rear brackets of the tower or at least use a rear place. So the other part of the CTPCI is a board connected with two 40 wires ribbon cables (must be short) with 3 PCI slots (one for graphical card and 2 others for what people will be able to do & develop).
- The slots will be 32-bits with ajustable clock for PCI (default will be 33 MHz and you may tune it up to 66 MHz : the PLX is not able to run PCI 66 MHz !). Voltages will be 5V and 3.3V power (no 3.3V on Milan PCI slots !).
- The adaptor will be slave and master PCI : this means that the PCI cards will be able to initiate a PCI master transaction to local bus and so SDRAM of the CT60 without CPU (the eclipse board is just slave, no PCI mastering and the CPU does all transfers in the 2 senses !).
- There are several good PCI graphical cards available : one will be to be

choosen by the developer(s). Several developers are ready to help and contribute, some of them have already contributed with fVDI by example !). So I'm confidente for this technical point...
- I will try to design the PCI socket PCB to be cuttable between the first and second PCI slot (to have a single PCI slot card) to allow some of you to try to integrate a small graphical card into their falcon case...(why not).
- Yes, it will be possible to plug the EtherNAT board under it.

If I receive the 100 boards pre-orders, I will design the board...and will request you to pay by advance. The payment is my only assurance that I will not be with some unsold boards after : 10 to 25% of people do not honor their pre-order (do not pay and do not give sign of life !).
Do not send money until I give you my decision (after 30.09) !
Do not forget to give me your name (for those who send me anonymous emails !).

Price : 120 EUR, maybe a bit more (140).
Delays : 1 months to design + 1 month to produce prototype and try it with some software developers. After production may take 1 to 2 months according the delays to get the parts (here the only that may give problems is PLX).

If you have some questions to decide, do not hesitate...

Rodolphe

Hello,

Sorry about that. Now and then I do have trouble with it. Try this site:

ftp.cs.tu-berlin.de

If you want 8-bit file goto the University of Michigan website and go into the Atari archives. You will see both ST and 8-bit file sections.

I'm honestly not sure what you mean by "organize your life as completely as Outlook".

But...

there are lots of Linux choices that sync with PDAs.

Hi David,

Yes please :-) Would definitely like to grab a stock copy of the MSTE disk. Not sure how much it differs from the ST one (GENERAL.CPX) but would like to get it in my 'formal' disk collection.

The email addy on here is valid :-) Just an account I check occasionally, using yahoo as seems to bounce all of the newsgroup spam.

If you're happy, I can put the disk up on-site to make it available to others.

Aly

Ello ;-)

Not wanting to dive into this debate here, but if you have some of the good (and very small, non bloatware) firewall software installed you'd be shocked to see what Windows software gets up to.

We tried this a few years ago and you have things like Word n stuff, getting totally obsessed with connecting to the net at various ports etc. If you stop it from doing so it just totally slows it down and things. Lots of MS software, and other software does it too.

An MS machine knows when it's connected to the net.... You won't get my Dad near an MS based machine, still using an IBM XT 286 with IBMs war-on-MS rewrite of DOS (IBM still support DOS, even now). Uses Net-Tamer for net communication. Refuses to be swept away in the computer boom, as went through it in the 80's and early 90's. (ooh, here come the next lot).

Aly

reminds me of that "notepad" security fix where hackers could take over your
computer *giggles*........

I always used outlook too..... In fact the way it started was I couldn't
afford to pay 100's for modems and net software, my first PC "the brick" old
286 jobbie with DOS and 3.11 cost me nothing, just collected spare parts
from people I knew and eventually got a PC built up and on the net... latter
95 and got started with outlook...

A Atari OS would be great virus wise for sure, data would be much safter in
atari format...... though for me I can't take the plung to the Atari mail,
been trying to get my falcon to work with CT60 for like a year.... thats the

BIG problem... if my falcon breaks, im screwed along with all my files.... if my PC breaks, assume the GFX card sets on fire, change the MB, gfx... easy fixes and im away again.... can't exactly pickup a new falcon MB when needed.

There pro's and con's for both...... though for the really serious net use who depends on E-mails (like I do) I can't afford to be without E-mail even for a day... and hey I even have another PC as a backup PC, all my data gets backed up and sent to the other PC... so if mine screws up at worst blowing up the drive and loosing all the data, I can just switch to the second and use that and reapir my main PC at leisure.... I'm affraid thats just not possible with a Falcon...... I can't imagine using a ST for it either, too many issues there to get into...

Atari is fine for probably the small general user, or hobbie guy, but if a PC breaks there are floods of parts for the taking, plenty of PC repair shops willing to break it even more.... just can't say that for the Atari scene.... Its not a matter of people dont want to use them, I'm sure a lot of people are all for using a Atari for E-mails and such, but when the thing dies, where you gonna get it fixed ? Where you gonna get spare parts from ? How much is it gonna cost ? how long is it gonna take ? When you add it all up, a PC wins hands down im affraid.

I'm not taking sides or trying to start a war, if I was I'd use a ST ;-)

Chris

The actual passwords are not stored any where. Most password files work like
this. Its called a "hash" its slightly different to encryption..

Hello,

Okies, have the uk version of XControl now, so getting there :)

One thing does puzzle me though (what again) and that's how to set the desktop colour. This awful grainy green is dreadful, as much prefer the original solid green when switching from mono.. Have so far edited the NEWDESK.INF file directly to put this to solid but there has to be an easier way.

Just checking before I click 'Send'... Nope, definitely not happening
here, Windows Colours is about as far as it goes.

Using XC 1.31 downloaded from here; ftp://gem.win.co.nz/hall/cpx/

Thanks,

Aly

Hi,

> Would love to hear more about this.

Here are some informations about the Pegasos

The board was developed by bplan. Actual version is Pegasos II mainboard:

http://www.bplan-gmbh.de/

Dual G3/G4 microATX Mainboard - Codename PEGASOS

```
- microATX Mainboard 236mm x 172mm
- 133 MHz Prozessor Slot
    Optional mit 350 MHz G3 PowerPC? / 512k Cache
    bis hin zu
    Dual MPC 7450 G4 PowerPC / 2 MB Cache in aktuellen Taktraten
- PC133 Hauptspeicher mit zwei Steckplaetzen
    maximaler Ausbau bei Modul Verfuegbarkeit 2GB Ram
- AGP Slot
    x 2
    vom Anwender frei waehlbare Grafikkarte
- PCI Subsystem mit drei Steckplaetzen
    fuer Anwender spezifische Erweiterungen
    ein PCI Steckplatz mit Riser Card Option
- IEEE1394 VIA VT6306
    mit 100/200/400 MBit Datenuebertragung
    mit drei Anschluessen
    mit drei Anschluessen
- 10/100 MBit Netzwerk Realtek Phyceiver 8201
- USB I/O System
    VIA 8231
```

mit vier Anschlusssen

- AC97 Sound Subsystem
  Sigmatel STAC 9766 Codec
  mit Mikrofon Eingang, Line In/Out
  und Headset Anschluss
  optischer S/PDIF Ausgang
- IRDA
  zur Komunikation ueber Infarot
- ATA100
  VIA 8231
  mit zwei Kanaelen zum Anschluss von vier ATA Geraeten
- KBD
  furr PS2 kompatible Tastaturen
- Mouse
  fuer PS2 kompatible Zeigegeraete
- Seriell
  fuer ein RS232 Geraet
- Parallel
  fuer Standard Drucker (Centronics)

  fuer Standard Drucker (Centronics)
- Floppy
- Gameport
  fuer PC-kompatible Joysticks
- 56K Modem
  integriert

This board was the base for a PPC bases PC from genesi, which can run MorphOS and Linux.

http://www.pegasosppc.com/

The PegasosPPC Platform is based around the Pegasos II motherboard:

You can get teh mainboard from genesi:

a) PegasosPPC

* Micro ATX form factor (236mm x 172mm)
* OpenFirmware (IEEE1275) boot interface
* Marvell Discovery II (MV64361) System Controller
* G3 or G4 PowerPC CPU
* 184-pin 266MHz DDR RAM sockets
* 1x AGP slot
* 3x PCI slots with riser connector
* 2x ATA100 IDE Channels

-* 3x IEEE1394 ports (400Mbit)

* 3x USB 1.1 ports (12Mbit)
* Gigabit and 10/100 Ethernet
* AC97 Audio Subsystem
    - o Stereo audio
    - o Microphone
    - o S/PDIF optical output

    o PC Gameport/MIDI
* IrDA, Serial (RS232), Parallel (IEEE1284) and PS/2 (Keyboard & Mouse)
* Floppy drive connector

I also, but i have some ideas

- Pegasos II Motherboards $499.00 (EUR415.00)
  Includes SmartFirmware, back panel, User Manual.
- Pegasos II Processors (This product is the CPU board ALONE.)
  Pegasos II CPU Card - 1GHz G4 (7447) $249.00 (EUR199.00)

There is also a complete Computer based on this board. It was named the Open Desktop Workstation and you can by it as a Linux PC which can also run MorphOS and Amiga Software.

The Open Desktop Workstation is based on the Pegasos II using the Marvell Discovery II Northbridge and system components of the highest quality.

> A PPC Atari I would love to know more about.

I also, but i have some ideas.

There is also a project with a coldfire board. It may be an interesting project, but i think it is more easy to use an existing board. The coldfire will come to late. Ii it comes in a few years, there is no one left who will use a Atari clone. A project which is made in the someones free time takes to long.

With the Pegasos a possible hardware is available and this board has many interfaces. A bit like the Atari St at is time. All you need is builtin.
Because linux is running on this board, it can be a base for Aranym.
But Aranym uses an underlying OS. in my opinion it was a little bit to much emulator for an PPC based Atari clone. While talking with my friend a got some ideas how to write a PPCTOS based on existing projects. I would like to use as much existing projects as possible. I would like to use the drivers from linux, some code i had to write, the 68040 emulator from Aranym and EmuTOS without Bios. All bios calls leave the emulator and are handled by teh linux drivers.

This can be a possible way to a PPC based Atari, and i think the fastest way.

Regards
Michel

Yes, but even though Atari is my computer of *choice*, when I have to use
a regular PC I *don't* have to use MS and its bloatware. Linux is mature
and stable - its what I run on my 3 comp LAN here.

Beats Windows to death and leaves it begging for a mercy kill. :-)

Hey, I played around with Arachne once. Nice software, especially its
ability to run on low-end hardware. Are they still around?

The better thing surely to go to SCSI HDD !!!
You may get some new problems with SCSI because of the famous SDMA clock patch !!

If you have doubt about your IDE HDD, replace it !!
That's easy to find old and good IDE HDD on ebay !!

I already told several times that some HDD IDE are not able to run coorectly on a falcon even if the bus is not accelerated because the HD Driver is running too fast with the 060 + SDRAM (TOS)...

I can only recommand a old and great QUANTUM FIREBALL !
A really bomb that was rating up to 9 MB/s on a F030 + CT2b !

You may go to 6 MB/s on a falcon + CT60.

Compared to poor SCSI with it's 1.5 to 1.8 MB/s, this gives you no problem to choose between to move to SCSI and to replace the IDE !!!

I think I may have damaged my Falcon cartridge port by plugging in the EtherNEC upside down! Now my Falcon/CT60 just resets over and over as soon as it is turned on with the EtherNEC plugged in. Without the EtherNEC it boots fine. This really stinks because I have gotten so used to MintNET and multitasking now! The EtherNEC still works with my STe, so I don't think it is damaged, but I wish it was that instead of the Falcon! Can anyone offer help here, or am I doomed to single TOS until the EtherNAT comes out; somewhere over the rainbow?? :-)

apparently there are fuses on the port, if they blow and you plug somethign
in, its probably pulling down some address lines causing the rebooting.

Hi,

Thats right, I wouldn't worry about damage to the Falcon!  There is a
fuse located on the Falcon motherboard near the cartridge port.  I
can't remember the part number, but it's something like 0.5A or 1A but
doesn't look like a regular mains/household fuse.  You could bridge it
with a single strand of copper wire, but only if you don't plug things
in upside down again :-)

Next short let explode +5 tracks on multilayer mainboard!

Microfuses can be found on good electronics stores.

Hi all,

I'm thinking of building up a small kit to allow a PS2 mouse to connect to a ST. Its not the same as Effile as such. The proposed project will be a small board (about the size of 2 regular stamps) which will plug direct into the mouse port ont he ST. The PS2 mouse will plug into the other end of the board. It will be a small compact design and won't require any case mods or anything.

Note that his is only for the mouse not the keyboard. With the demise in ST mice and the cheap flood of PS2 mice I think the project if worthwhile.

It will take some time to develop, techie_alison has been kind enough to research the programming behind the device and PS2 protocols. I hope to have a few test boards made up over the next few weeks. After that will be a more updated design. I imagine each kit will probably retail for around �15, it will be a plug and play solution.

If there is enough interest in the project then I will consider building a small batch and get the boards made up at the PCB factory. If there is not much interest then I won't go further than the sample boards. If there is interest then great, more people = cheaper prices and a factory manufactured design.

your choice!

Chris

Speaking of the Eiffel, the mouse protocol conversion work will have
been done already, so why re-invent the wheel? Can't you adapt the bits
you need from that? (Copyright issues not withstanding).

Coda.

Yes and no, the first batch will be a very basic "copy" type design. Though it uses older parts which are expensive, if there is enough interest then the project will be "re-coded" to use cheaper more ready avaliable parts, Though of course its only worth doing for larger batches.

I give in,

What is the address range of the SDRAM on the CT60 ? I have a 128MB stick so if anyone can tell me the address ranges then I will just write a program, its only peeking and poking into ram, easy enough, probably wont be to fast but at least it will work!

any idea what ram pattens to use ?

I'm guessing for a 8bit type one things like...

01010101
10101010
00000001
00000010
00000100
00001000

```
00010000
00100000
01000000
10000000
```

That *should* do it ?

Chris

Michael,

We tried to get a development system to port MiNT. Genesi promised a development system. They asked for the address to send the system, they NEVER sent one.

They would respond, then stop for a few months and start up again. After almost 2 years of playing pong with e-mails.. still nothing. I gave up late last year on contacting them any further.

The Pegasos was in our minds the best option to get new hardware. Custom Atari Hardware with it's small production run makes it expensive. I'm sure Rodolphe could agree with that. With the Pegasos being multi platform they had a wider base to make larger production runs to help bring the cost down. ($399 USD for a G4 system)

But, I doubt Genesi will be around much longer. Our best bet is to support Czuba with his Hawk project and also try to get the Pegasos Linux community behind him. Remember, the more units sold will help bring the cost down.

Rodolphe - Any chance of you getting the Hawk information on your website soon?

Rob M

> boost to a switch on the front panel first.

Ok, for all people who try to run Doom on their system, and have problems.
You must check without anything loaded, then progressively add features,
till problem arises. You must add features one at a time, to be sure what
feature is causing the problem. It can be any of:

At system level:
- tos/mint/magic
- gem/xaaes/naes/magic aes
- accelerator board on/off
- fastram present or not, and its amount
- amount of stram available

At SDL level:
- xbios/gem video driver (in sdl, switchable with environment variable under MinT)
- audio driver (in sdl, switchable with environment variable under MiNT)

At Doom level
- software features, like audio on/off, texturing on/off, etc...

Telling it does not work on config x.y.z is not information. What is
info is 'feature n works with x.y.w but not with x.y.v'.

> 2. Im guessing that your command line options dont match the original
> doom, as -nosound and -nomusic dont do anything. If so can you post a
> list of options?

RTFM :-).

> 3. On default I usually have Iphiginie running to set the matrix so
> that my sound goes out through the FDI/SPDIF instead of the headphone
> soicke. I notice that when doom starts it initialises the sound system
> and removes the clock to the FDI. Any way of keeping the FDI output
> while setting the sound as normal?

There is no way to read current audio matrix connexions, and to know which
peripheral are connected or not. On a standard Falcon, at reset, no audio
matrix is done, nothing is connected. Plus, I check if there is an
external clock on DSP port. I need more info about your SPDIF interface.

> 4. Rename doom.ttp to doom.prg and it runs at least twice as
> fast...?!?!

No idea, maybe a special ct60 features that disable caches.

> 5. Press F1 for the help screen. Another key to get to the second
> screen. Dies with the message: "W_GetNumForName: HELP2 not found!".
> This may mean that my .wad is corrupted. Can someone else check this
> out?

WAD too old, try getting the latest updated game version (1.9 for
Doom/Doom II).

> 6. Under MiNT the average load while doom was running was only ~30%

Nice.

Trouble is with the current offerings is that they're not there to buy
straight off the shelf. Also, there are issues with some of the
examples with irratic mouse movement and alike. Eiffel is super
hardcore stuff, quite outstanding actually, but perhaps overkill for
someone who just wants a reliable mouse. I'd build an IDE interface
before I did one of those. I think you also lose your Atari keyboard
too. Quite alot of unnecessary components on that schematic, quite
power hungry too on a little ST.

Good, very good! I hope you're already thinking about a way to sell your
adaptator worldwide. Well, at least to let it go through the tunnel,
just for me.  ;-)

My optical mouse must be around 15+ and starts to show its age, in
particular its special mat is rather worn out and I have a spare optical
Logitech that would fit well with my Hades. A plug-and-play adaptator is
all I need.

I hope there is some way to use the wheel of the mouse. That the thing I
miss the most when I go from my Linux box to my Hades.

See ya,

Would like to use USB actually now, not sure if the protocol is the same as
PS2 though it must be since you can get PS2-USB cables.... PS2 looks a bit
to wide on the plug (is on my mouse anyways) so will have problems there
unless the plug is filed a bit..... USB fits nice under the port area along
with the PCB..

Yeah, Even though I was all for using chunks of the code, I feel as Alison
said it would be best to actually write the code bottom up, then at least we
know 100% whats going on rather than trying to debug pages of someone else's
code...... Sorry coda we are gonna re-invent the wheel..... mabe get some
new spokes and a good polish for it too ;-)

Problem is with the wheel , there is nothing in GEM to support it, so there is no use in making a adapter to support the wheel...... after all, all the ST has is up,down,left,right,fire...... where are you going to put the wheel data ? Even is a way was molished to get the data into RAM, it would need someone really clued up on GEM to be able to read these values and in effect press the UP and DOWN key on the keyboard..... assuming TOS404 (or whatever) when pressing the arrow keys alters the window pos..... So sorry its not gonna happen, I would like to use the wheel aswell TBH... will keep it in mind.... dont forget this is only a simple adapter, it could be possible with Effile with some mods, but molishing a project like that is far dar down the line..... and would still need patches to GEM........

Chris

You are correct!  I checked the continuity of F2, and the fuse is
blown.  I have it jumpered temporarily until I can find the
microfuse.  I'll be very careful with it :-)

I live in a small town, so I'll probably have to search the internet
electronics suppliers for it.  Thanks for your help!

I use to run Net-Tamer on my Falcon using the FalconSpeed 286 board.
Before we finally got a PPP Atari solution to Web Pages.

Not bragging, but I think I was the first to try that and get it working on the Falcon.

It worked really well, speed was fast. Up to 57600Baud using the Falcon modem port in DOS.
Net-Tamer had or has just about all ya need. E-mail, News, Web, etc.

Never could get Win 3.1 to work with the Falcons Modem port.
I don't think it was supported. Not that I used Win 3.1 that much anyway.
Running DOS was Cool, alot like using SpartaDos on the ole 8-bit Atari.

I still have my old 80+meg Conner IDE setup to run FalconSpeed and have 2 FalconSpeed Boards.

Net-Tamer would run on just about anything. I think there is even a pre
286 version.

I have a SuperCharger too, just about bet it would work on it. Would
like to find
a 286 or better upgrade for it.

Haven't tried the 386 version on my Vortex 386SX in my MegaSTE yet.

I sent in the registration fee for the program.

Have there been any updates in the last 2-3 years?

Tell ya Dad to run it on a Falcon for some real Fun!

With MiNT and XaAES you can use mouse wheels. And for MagiC there is a
little tool from Armin Diedering which implements this into GEM.

So if the mouse wheels are supported in GEM, then how is the data processed
from the wheel to GEM ?

Some mice will recognise whether they are plugged into PS2 or USB, and act
accordingly.

Eventually things will drop PS2 support, just as RS232 was replaced by USB.

There are various ways. The Milan VDI supports wheels, and have vex_mwheel() (or some such called function) which things can use to get wheel events. On other machines (other VDI's without this support) I hav no idea how wheel data reach GEM, but I have a hunch drivers hook into VDI trap vector and implements vex_mwheel(). XaAES have very good support for wheels. I think building a new adapter like this needs to include wheelsupport ;-) If you ask for help with software, I'm sure someone will help you. I can help with low-level MiNT drivers to make XaAES take good advantage of it.

Best Regards,
Odd Skancke

im all for wheel support, dont get me wrong! Though I can't see how GEM read the data from the port, AFAIK you only have the 6 data lines......

The only way which it *could* work was if you use UP & DOWN and the same time for a wheel up pulse, and LEFT & RIGHT for a wheel down pulse..... though of couse GEM would have to read those values in and act accordingly.

if anyone knows how GEM reads the data, or can delv into the wheel code, and tell me how its reading the data from the port then that would be a BIG help..... unless I know HOW its reading the data then theres nothing I can do!

Chris

I believe, if I'm not mistaken, that MINT supports a wheel mouse, so it is
something to think about, even if its further down the road.

hmmm, I aint clued up on things these days, is MINT MultiTOS ? Whatever
supports wheelmouse, well I will need a copy of it, in fact if I have wheel
mouse support I might just plug some values into the port and see what
happens... if there is a patch of soemthing to get it working on my falcon
then please send me a copy, can't do anything if I dont have a OS which
supports it......

cheers
chris

MiNT (FreeMiNT today) is not MultiTOS, but it has basically the same functionality. You can get it at http://sparemint.atari.org.

and its not *that* hard to setup. If you have questions, post them here, oodles of people will attempt to help you.

Heck, if they can help an ID-10-T like me get it running, then anyone can do it! :-)

aye, ive looked at that before and aint got any clues whatsoever to set that lot up. Plus not everyone us using it so there wouldn't be use in making a adapter run with that little lot.

To refocus, I think first we need someone to track down the code which is controlling the wheel, then we can take a look into getting the controller to provide those data inputs..... Plus I think it would be a good idea if then someone wrote a small patch just for generic GEM, to add in that option..... I will help develop the hardware side of things but I dont have *that* much time to get into the software side of it aswell.

Like I said a UP/Down press would be the only way to pass the data though, I am not sure how GEM would react to that, hopeing that it wouldn't do anything, as such a small patch to check for that sequence of events and press the down arrow key. That would be the easy solution. Though like I said someone else would have to develop the software patch first!

I think for now is get a generic kit up and running, if enough people support the project, then it would be worth spending a bit more time into looking into the wheel and maybe other things.

The way I see it, if I'm sure Effile supports the wheel ? it interfaces direct to the MB, it would be easy to recode the mouse wheel data to push the up or down arrow key on the keyboard... Though Remember this new project is *not* a keyboard one.... I think this is where the confusion is comming from.

Its *not* the Effile project for mouse and keyboard, its a smaller project *just* for the mouse. As such I don't think it will support the wheel, just not possible without a lot of work. I think if people want to use the wheel then they would have to consider using Effile..

The project at the moment is to interface a PS2 mouse to the ST without having to do any case mods, change the keyboard, or "mess about" in anyway.

If ppl only want to use a new mouse, (which I do) then , if enough sell to fund future developments (which I doubt will happen) then we will look into other things.... Though I think anyone who wants to use the Mouse should use Effile and do all the needed mods etc.... If there is enough demand for Effile in the EC/UK Then we will look into building up some of those.... I dont think the PCB layouts are avaliable so in order to design the PCB there would have to be sufficient demand.

Hope this clears a few things up.
Chris

This sounds like my problem! The EtherNEC worked on my TT fine. When I moved it to my CT60 it stopped working. CT60 won't boot with the EtherNEC installed. And my TT is in storage. Wish I had room to have all my Atari's setup.

Besides jumping the fuse, I have no way to test to see if it's blown. Do the micro fuses change in color? Meaning give a "blown" look like normal fuses. It looks like the fuse in F1, so I can't tell. I must need glasses now..

Rob M

Neodesk and the CT60 appear to not get along very well.

Geneva does run via the CT60, but for some reason slows the system down
so that Geneva on an accelerated Falcon feels about the same speed as
on a stock Falcon. I do not know why this is the case.

Early indications are that the SCSI chain is not sufficiently stable
without the external hard drive being on. With the hard drive on,
everything tested thus far appears to work.

I'll do more tests as time permits, but who among us has SCSI problems
when items in the chain are off? I've heard of this, but have never
encountered it before.

Your problems seem a lot like the ones I've had in the past.

Run the modified control.acc with the ct60 config cpx and NVDI 5 first.
 Also, find out what kind of ST RAM card you are using -- this could be
the problem as the CT60 is pretty sensitive to ST RAM.

Are you using HD driver or Cecile?

FWIW, my problems turned out to be a questionable 68060. Even thought
Rodolphe sent the original CPU to me, the chip was not stable at 66Mhz.
 A new 68060 solved that problem.

ST RAM tests out fine, ram normal ram tester for that. I have NDVI4 or 5 upgrade (legit copy) but I can't find the actual NVDI install disks, unless NVDI is freeware to download then I can't try it :(

im wondering about that also, but ive got mine running on 50mhz now, seems a fraction more stable but hard to say since the crashes seem random.

Asking questions again...

Is there an editor for .ST floppy disk images available to run on linux or windows? What I am looking for is a tool that enables me to add files from my pc harddisk to a .st disk image, just like StarCommander does for the C64.
If there is no such tool, is there an emulator that allows to access files and/or folders in the host file system, as well as writing to disk images (which would be a workaround for the problem given above)? Linux preferred.

Thanks for any help,

Chris

Google it. There must be many pages on the subjects.
http://www.microsoft.com/whdc/hwdev/tech/input/mcompat.mspx
http://www.microsoft.com/whdc/hwdev/tech/input/5b_wheel.mspx

Right now I'm in the middle of looking at a PS/2 keyboard to Atari 8-bitter keyboard.

holding down both shifts skips SDRAM

ALT-C opens up a new drive window for C:

CTRL-D changes the screen to drive D:

all keys working fine me thinks.

booting without SDRAM changes things a bit, instead of getting a crash screen the screen just goes black and either locks up and/or resets.

I've got CTCM comming so I can have a play with that, though im getting tired of trying to get the thing to work :-(

I've tried 3 or 4, 133mhz CL2 128MB Crucial the one which is in now.

a while ago I sent my falcon with CT60 to rodolphe for testing, he sent it back saying theres nothing wrong with it, the only thing I didnt send was the hard drive, thats why I've trying moving things to SCSI, its the only thing I can do really. The only other thing would be to scope out all the necessay PSU,data,address lines etc and see if I can spot anything amiss between 030 and CT60 mode, its rather time consuming though probably just be easier to take the thing out and forget out it. I could send it back to rodolphe though I really can't see the point.

the diagnostics sounds interesting, though like I say that don't work either :-(

Hello,

This 0.45 release has only SDL bugfixes, not much change on Doom side. However, I added memory left on ST-ram, because with 4MB ram, the game may not have enough memory for video or audio buffers.

I dont think the diagnostics are gonna help you.

Thought... put a multimeter on the PSU lines and see if the voltages
are in tolerance (esp 3.3v).

Thought 2. Are you running NVDI at all?

And you never took 5 others minutes to do a packet and send me the CT60 !???
That's a bit pity really ;-)

Will check PSU, its a 400W jobbie, ive tried several suppies...

im only running plain GEM.....

ive taken some screenshots of the crashes, will uploaded them shortly.

chris

actually if you read my other post I did send my falcon and CT60 to you for testing some time ago, I dont have too much time to play with my falcon these days so this is why I keep posting from time to time about it.

I will upload some crashes... plain GEM, booting or changing video mode, that is all!!

Chrsi

Hello,

How do you get this astouning transfer rate ? would you run MiNT ? on
my 100MHz FalCT60, I hardly get 40 kb/s between a PC and it :-(

Thanks,

J.-Luc

Hi,

Might sound like a silly question, but how do you get a Mega STE with an internal SCSI drive to boot from floppy?

Have tried and tried and tried. Not helped with it being a German TOS 2.05. Just bought it off of eBay for �50, no real yellowing, just a bit grubby, into the bath it goes for a good soak (minus the components naturally). :-)

Thanks again,

Aly

1. Must be a cold boot.
2. Immediately after mem test finishes, hold down ALT.

You can abort the mem test, I usually press space then immediately hold
down ALT.

This works for disks that boot from the AUTO folder. Boot sector
booting disks (like some games) will boot without your intervention.

Coda.

Can you try this http://membres.lycos.fr/pmandin/download/audio.zip and
test under various configurations (tos 030, tos ct60, mint 030, mint
ct60)?

YESSSS! Great!
Just one problem: I can't download audio.zip to test :(

Thanks Coda :-)

Will try it shortly when it's back in it's case.

Next one to get me wondering is, what's the DIP switch settings.

Jean,

Actually that is an average. There has been many times where I get 175 KB/sec. But there are rare cases where it dips to 50-75 KB/sec. Usually longer transfers tend to fall in the 75 to 100 KB/sec. But just 20 to 50 megs will give me easily over 100 KB/sec. I could try and get a screen shot if you dont believe me. I use Magic 6.20 FTPSERVer for the Atari and Fiffi as my FTP client. Connected to a router. On the MAC side I forget actually how I set it up over there. But they are just a few feet from each other so I run short cables and I am sure this helps. The MAC seems to have superior networking capabilities that keep the data streamed better. I know this because I have tried transferring data to a PC using my exact setup and it seemed slower.

Thanks,
Carey C

If there is not enough ST ram for audio/video buffers, then Doom will
exits. And for video buffers, it tells how many KBytes are needed.

Don't you HAVE to use NVDI with the CT60?  I get some very interesting
screen problems without it.

What kind of screen problems ?

I can't boot to plain gem half the time, then all of a sudden it will work
for half a hour fine..... I could try installing it..

I just downloaded and looked at those pics. Others will be able to tell you better than I, but on my setup, I believe it was faulty, "not CT60 friendly" programs, ACCs, and CPXs that caused crashes on my machine that looked like what you are seeing.

Particular, the flag must be set for a lot of apps so that they don't load into Fast ram but ST ram, or are delayed in what they do. (again, others will step in here I'm sure, and explain better than my pitiful attempts).

Did you download the software package from Rodolphes website? The one that has things like the updated main CPX control accessory in it? Thats a must have.

If it is some apps/software, I'd start by disabling *everything* and booting up just as "plain Jane" as I could. Thats how I found what software was giving me errors like you are seeing.

Hope this helps.

Anyone keeping a list of all the current Atari FTP sites?

If so, maybe someone could post a list.

And specify if they are active or not.

Some google results (look older though):

http://www.umich.edu/~archive/atari/Info/atari-ftp.sites
http://www.dsv.su.se/~fk/AtariFTP.html

Hallvard Tangeraas used to maintain a very good list, but I don't think he does anymore.

I also have a list on my BBS, it should be more current than whats above.

the screens were either changing res of booting, that was plain gem. im
lucky to get as far as the desktop!

disabling SDRAM seems to help, though it still crashes on loading programs,
so even so still something else wrong somewhere.

Chris

I'm having that done now, but this was before. Just the CT60, hooked up
to a stock Falcon MB.

Before I'd go with MultiTOS, especially for multitasking, I'd recommend Neodesk/Geneva, and altough I'm not a big MagiC fan, I guess I'd still have to recommend it over plain MultiTOS as well.

My first, best recommendation though, would be to take the time to learn and install MINT.

Honestly, that sounds like its because some AUTO folder programs or
ACC/CPXs are causing your problems *first* before you get to the desktop.

You need to do like I mentioned before. Download the updated software for
the CT60. I believe you can get it from Didiers or Rodolphes web sites.

Disable all your current software. All AUTO folder programs and ACCs/CPXs.

Don't try to load a kazillion things at once. Start by adding one AUTO
folder program, or ACC, or CPX at a time. If it works without crashing
move on to the next piece of software.

Trian 'n error is the way to go. I had to do this with my CT60 Falcon.

Use the software from the package you downloaded.

Included in it is the the info/config CPX where you can set the flags you
need on software.

HTHs.

thats odd, sounds like the blitter is having problems then, I have NVDI (I think) so I could try booting with that installed and see what happens then.

no I mean if you disable the auto folder, CPX, EVERYTHING, it does not matter, I went though all this some time ago, I thought a CPX was causing a crash, so disabled them and rebooted several times enabling each CPX and auto program one by one, eventually after hours of work I ended up with nothing disabled and it worked fine. went back to it a few hours latter and just kept crashing over and over. If I turn off my hard drive and put a blank floppy int he drive then *maybe* I can get to GEM more often.

and yes I got all the new cpx's and stuff and updated.

I guess its just not to be :-(

You dont have to use the unix "features" of MiNT. And its not lynux
(sic) based.
MiNT is basically a TOS not GEM replacement (developed from MULTITOS).
The Unix part of the MiNT distribution (Sparemint) is just a set of GNU
unix based tools. You dont have to have them but it gives you a lot
more power and freedom if you do.

Download the latest Freemint package which includes the MiNT kernel and
an AES (XAAES) and put your desktop of choice with it.

You dont want to run MULTITOS, plus the AES that comes with it is full
of bugs.

Please don't attempt to put words in my mouth - I said I loathe everything
about Microsoft, not computer users. Most of them are just misinformed, or
lack a comprehensive education, as far as computing goes...

Yes, i also like original case, it is nice and compact. U dont need to recase it and external psu is not that bad, if u buy 15cm extension cable and mount it on rear side and ct60. In that case u can connect external PSU same way as we did with 520ST or Amiga, c64 etc.. On back of the Falcon, there is only "PSU jack". I did that with MKX case, which is not much bigger as original case anyway..

Janez

I see also prg crashing on exit. It happens with xbios video driver in 8 bits mode. Using '-bpp 16' works. Also I need to know if it happened with previous versions (0.43 and before). Can you check it does not happen with gem video driver under MiNT + GEM ?

AS I already told, I already request to people about a such CTTT and I get
only 30 responses !

I will never engage a design for 30 sold !! And all the TOS must be patched
like on falcon it was done !!

Sorry...forget...buy a falcon.. if you want a 060.

If you can propose me a list of 100 persons ready to buy a CTTT, ok...

The falcon is more special, and surely that's why.. It's a shame the TT's are going to go to waste considering they're faster to start with. Easier to find a good functional video card too. I think everybody understands Rodolphe, but I was told by my old roomate that such a proposition was made long ago and the number of required people were there, but you decided for whatever reason not to do the project.

Thanks,
Mark

Not to mention tiny ITX PSU's are quite cheap now and could probably be made to fit within the Falcon. I'm sure it's been done. The CT60 was designed to fit in the standard falcon case still. It's the PSU that needs to be taken care of.

Thanks,
Mark

A good place to start is here:

http://www.anodynesoftware.com/

ExtenDos Gold and CD Writer Suite.

I use the writer software with my Mega ST and a CDRW.

I've not had a chance to test it on my CT60 equipped Falcon yet, but it works stock there just fine as well.

CT60 didn't fit in a normal falcon case, thats why you need ctex ;-)
I'd like to fit in a internal PSU also, its just finding the time to mess
about with it all really :-(

Chris

Well, I tested all versions from 0.40, and all had the same bug. And I
found the cause in SDL, so you can stop testing, and wait for 0.45.

I remember that. Anyway, apparently there was a fork in the road and he had to dedicate energy to the TT or the Falcon.   Personally I always thought the Falcon users and TT users were about even. More maybe TT users became Hades and Milan users?

Well, question is, you have a upgrade that will work with the Atari motherboard, an '030 setup, and apparently TOS 4.06.   Rather than splitting effort to make two seperate upgrades, what would it take to have the TT emulate what this environment is working with?

In other words, what does the CT60 look for... you say the it is hacked for the Falcon TOS. What exactly does the CT60 work with in that TOS and with the Falcon setup that is different from the TT?

How much of the TT is similiar to the Falcon?

In the case of the CT60.... how much of the original computer board is actually used once the CT60 (or CT63) is working as it should?

Just humor me (and the other 30 TT users wondering this) for a few minutes.
 :)

You are wrong about the fact that I may have be able to developp CTTT !
I never get more than 30 pre-orders on CTTT !!
If somebody can get 100 pre-order, it's ok for me !!
Hey, try ! move ! do announcments on NG and atari.org and anywhere
```

else...and you will see...

I have now no more time to try a second time to convince people on TT.
For me TT is really dead because it has no demo/game scene support, what is one of the last support on Falcon !!

> Well, question is, you have a upgrade that will work with the Atari

4.06 ??

The CT60 use a patched 4.04 !
It took 1 year to Didier to patch all things into the TOS to get rthe result you can see this day : all integrated into the flash : no drivers to install, no FPU library to install... a great work !! really so better than what was on Afterburner (bad software installation and distribution !!)

> In other words, what does the CT60 look for... you say the it is
> hacked for the Falcon TOS. What exactly does the CT60 work with
> in that TOS and with the Falcon setup that is different from the
> TT?

> How much of the TT is similiar to the Falcon?

Hey the hardware of the TT and falcon is 80% different...
All the BIOS/XBIOS is different !
So, it is a necessity I think to start from TOS 3.06 and patch it ...it will take 1 year too ???
Too long !
Didier has no time and I understand he want to do somethings else... more interesting ;-)

Maybe it is possible to patch without the AES & GEM part and add the GEM/AES part of the Falcon TOS....but is is very complex to do...
So it is better to not dream...

> In the case of the CT60.... how much of the original computer
> board is actually used once the CT60 (or CT63) is working as it
> should?

The CT60 may be able to run without the motherboard if the TOS into the flash is patched again : a BUS ERROR special root should be added to return from all the BUS ERROR we may receive if the 060 try to access where there is no more hardware : I have to generate this BUS ERROR for all Falcon / TT addresses...and so it is possible to run CT alone.
But no VIDEO, NO KEYBOARD, NO HDD, NO SOUND !

It is why I may need to develop a PCI interface and add the EtherNAT card on the CT !

Regards

CT60 fit into the original case and you do not need CTEX for that !!!

The first CT60 have a big fan than cannot be put under the keyboard, but if you use a bit you brain, you will find a way to put the heatsink differently and be able to close the case ! I saw many people that put CT60 into the original case !! One way is just to find a smaller fan and put it near the heatsink.

SO, PLEASE STOP to spread BAD INFOS !!!

Now the CT63 is furnished with a very thin heatsink+fan bloc (have a look on my web pages !!)

All except 030. Videl still generate GFX, STRam is sill video RAM, DMA is used as before, I/O is used as before, sound system, DSP as well.. CT60 provide just faster CPU and Fast RAM. Also it can provide bus/stram acceleration, but that doesn't change anything functionality wise. CT60 falcon is basicaly same as 030 falcon.

Hi all,

i've got a IDE and SCSI drive connected to my falcon, both work fine
together.

i've copied everything from the IDE to the SCSI drive as I plan to only use this one

I booted from HD8 form floppy to install just the SCSI drive and its not working right. Drive C: is drive D: , I get drive C: icon but I can't access it. The falcon is booting from the SCSI drive though I can't seem to get it to configure correctly.

on booting the IDE detecting bit comes up IDE 00.00 then a row of funny squiggles, it does that in HD8 config also, the IDE drive is now unpluged so it shouldn't be detecting or using that drive.

Could the SCSI drive being screwing up the IDE in anyway ? will keep trying though its getting annoying now :-(

Chris

Hi all,

While messing with booting of my falcon, if I hold down ALT during boot to skip HD booting, the SDRAM test speed halves ?

Shouldnt be. The IDE in the Falcon is problematic at times. I was
getting the IDE 0:1 drive detected as a load of
=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC=AC chars when using a part=
icular 80pin
cable. When I use a 40pin single connector cable, or a double with a
CDRW plugged in, its OK.

If you are getting drive assignments that you dont expect you can force
the drive letter inside hddriver to be what you want on each drive.

Hi all,

Yet again trying to get my falcon to PC netowork to work again....

This is what I get with FTPSERV below...

Network must be working since its trying to logon, I have the passwords set to "*" so anything should login, though this is the problem I keep having, started from total scratch and hit the same problem :-(

Chris

I think the CD driver you use is the problem ...it runs too fast with 060 !!
Did you try to remove the FAST RAM flag to allow it to load into ST-RAM
instead od SDRAM ??
It will slow it..and maybe software timings will come back to good values...

What is the CD driver you use ???

If it is the extendos, you should report to the author !! He is a CT60
developer... !
Thanks

This is correct, but usually it's better to find out why the behavior is
not as expected.

IDE and SCSI don't influence one another, indeed. I also suspect the
cable to be the problem. I had similar effects when experimenting with
2.5 to 3.5 inch adapters.

I had that ���������������  problem without the drive pluged in, I
reinstalled HD8 onto floppy and booted from there with no drives pluged in,
setup HD8, installed it on C: again, then turned on the SCSI and installed
on C:..... anyways managed to get it working now on SCSI only :-)

I do think my IDE cable is a bit bad though, its a internal 2.5" IDE, I
think SCSI will be a bit faster... also a 2gig drive not my 540MB IDE ;-)

Cheers,
Chris

Its been a while but don't you have to tell it to tranlate the passwords
before use...
Have you run "GENERATE PASSWORDS"

I use a 10gb 3.5" drive on a 2.5->3.5 converter cos I had both lying
around. You can pick up 2.5" 20gb drives pretty cheap now though, but
its difficult to use all that space if your not running MiNT (and even
if you are, I suppose ;-))

yeah, but thats all it does is genereate passwords, rather long ones at
that.... setting the password to " * " means they are ignored, I even tried
using the example users file and logging on with the ones in that, still no

luck. pass word or not it just gets stuck the same.

Its like the TCP protocol gets as far as to logon and gets stuck on passwords...... I've tried a few versions of TCP.STX (I think that was what it was called), still no look. Tried ENEC and ENEC3 STX's also... its just so simple it can't not work really...... I had it working once when I first brought EtherNEC, but it don't work anymore, I dontknow why. Even tried a STFM and a new network card.... seems to be some problem in the software somehow...... *shrugs*

yeah my 540MB is about full, took me hmm, about 15 years to fill it :))  not
sure how long it will take me to fill a 2gig drive ;-)

i had that message too :)))

I use PC as ftp server and atari as client - there are far better atari clients than servers ;)

have fun

that shouldn't bother any of them...check nvram hard disk boot sequence settings - boot from ide or boot fro scsi...
make sure your C: is not greater than 32 Mb, should help...
;)

I take it you didnt manage to solve it then :)

what would you recommend for a client ? I have not much idea about setting
up the other way around....

Hi all,

While my fav. ram test progs test fine with my 4MB in my falcon, is there any ram testers to test the 128MB in the CT60 ?

Cheers,
Chris

Should be able to use anything that can test TT ram. Cant think of any
though.
Maybe you could write one ;-)

Please note that there is no special size limit for C:, even AHDI will
work with bigger C: partitions. C: may be es big as any other partition,
which means it can be up to 1 GB on the Falcon.

yeah I probably could write one, but never got my CT60 to run more than

5mins without crashing, hence the need for the ram tester..... bit ironic
really ;-)

No it doesn't, what it does is to turn the passwords to "hash values". After
running "generate passwords" you still enter the original password not the
hash value in the file. If you don't do "generate passwords" you won't get
on. It works fine for me provided I do this.

nope!

if you have a userfile such as....

name password c:\ 1 d:\ 7

and generate passwords...

name 348th348t9ph34p89htq34tpp234h34hqr9w c:\ 1 d:\ 7

like I said not typing in that lot for a password! the option is practically useless really.

As the CT60 came it does not fit in the case, if you remove ran then maybe it will fit. maybe if you fit alternative heatinks also, you your self said not to try to remove the heatinks as of risk to the CPU!!!!!!!!!

So as as said it does not fit, it is not bad infos, you talk about modifications to CT60, hence you only need modifications since IT DOES NOT FIT!!!!!!

why hypertext ?? I tried that site which had the online converter and it
seems to have gone :-\

was just something I noticed and wondered about!

where is the document exactly anyhows, never seen anything on such things,
looking around czuba tech and lots of hardware infos but I assume you mean
instructions ?

dun matter found um hidden away in the software package!

it says hold some keys down before the logo to enter a diagnostics mode,
which sounds fun... if it would actually come up ?!

Hello everyone,

I am looking for two ST programs that I know neither the names of nor where to get them.

The first one is an Omikron basic program that creates and rotates a 3d ball, that is, a wireframe model of a ball. The person who showed me this back in the 80s told me he wrote it himself, but later other people told me this was a demo that came with Omikron basic. I don't know which is true but if you can help me getting this program I'd be very glad.

The second one is a (stand-alone) demo I only remember vaguely. It is a kind of programmed movie sequence of a miniture flight into the interior of a computer. Does this ring any bells with anyone?

Thanks in advance for any help,

Chris

Chris,
  Hi!!!  If you need help I can e-mail the files I have so that you can
get your FTPSERV setup on the Falcon.  I have my Falcon able to access
my MAC through my ROUTER.  Very fast at about 100 KB/sec average.  Just let
me know if you wish me to e-mail those files and information.

Thanks,
Carey C

Hello Chris,
  I may have this BALL one your talking about for the ST. Does it
have kind of a moving ATARI floor so to speak at the bottom of the screen??
it was also in 3D and had mirror like affects on the ball itself and the
floor had shadows of the 3D ball moving forward (at you) on the screen.
Actually a very good little demo. If I can find it agian on my 4 GB HD and
or my 1 GB HD that is hooked to my 1040 STFM. I can pull them onto a floppy
and send it right over if you wish. The other one I seem to remember that
one as well but I do not have that one. If you get it I would love to have
that one to my collection. Let me know!!!

Thanks,
Carey

Hi Ed,

Not sure if these people could help, Bravo Sierra Computers; http://
www.aracnet.com/~atari/st_soft.htm#top

Geography Tutor; ASDE; Educational
Data Base.; Disk & Manual..$7.50 U.S.

Might be an old link, but maybe not. Their home page refers to all sorts so maybe in luck. Oooh, has a reference to 05/09/2005
here; http://www.aracnet.com/~atari/newstuff.htm

Hope this helps you out.

If you gain or learn something form doing the project then I dont think its a bad thing. I kinda gave up a while ago after doing my 1.44 boards, god knows how many people said they wanted one, so i spend my time and cash into getting them made then all of these people "vanish" and leave me out of pocket.. Funds I would have made would have gone into other projects. People kill themselves so don't blame yourself for it.

I for one am glad you did the article, I never documented it when I made my 4meg simm PCB's, so its usefull to have! I should really write a article on my 1.44 controller since its unique, though I imagine someone will copy the design and publish it themselves under thier own name... thats normally what happens... Plus there is so little interest in the things it would be pointless in writing a article on it since nobody would be interested anyhows.... Even if I did I would probably get flamed for it.. thats how things work these days, and thats why I have pulled out of supporting..... my final word on it all was sent to the guy at UCM a while ago, in fact I wrote a few thing in there about people flaming me when all I did was help ppl.... the friendly group isn't so friendly anymore im affraid :-(

Chrsi

LOL, nooo, Derryck was quite nice about it, was good about it for an honest
reason.  These were just the trolls at the other end of
the spectrum, ..the wind up merchants.  Not a prob now, have deleted the group so
should keep em going for a few days, mostly they
talk about washing machines and "Did anyone see that branch on the road this
morning?, ooh we must phone the council."

Hee hee, got some pictures coming to you boy, getting ready now with the ST..  ;-)

7 SCSI?!? You are a high priest of SCSI voodoo! (I thought I was impressive for 5 on my stock Falcon!)

Seriously, what I've been running into is the following:

Given HD 8.13 and the following chain: CT60ed Falcon -- 340MB Lacie HD -- Panasonic CDR -- external terminator, I had no problem with the SCSI bus under the stock motherboard (no solders). After the board came back from Rodolphe with solders (and now 25MHz), the HD appears to work correctly, but the CDR has the following odd behavior:

1) refuses to read a CD that it read perfectly two minutes earlier "Drive P: is not responding..."

2) pretends to burn a CD (CDISO gives no errors and reports a ready-to-use CD), but the result has directory errors (that is, the CD is the correct number of bytes, but folders and files are missing from the directory).

3) adds bursts of static while playing CDs on Aniplayer

I spent much of yesterday copying 8MB ZIP files from place to place attempting to find a pattern and ... had no errors whatsoever?!? The only thing I can think of that is different is that I rarely have the external HD turned on. On my stock Falcon I've long had the habit of just turning on the device I intended to use, but perhaps the CT60 Falcon is more sensitive?

I'll find out over the next few days if my CT60 Falcon has suddenly become more cooperative.

Galen

Is this under TOS or MiNT? My prob seems to occur only when running
MiNT, the audio appears to be just fine when I run pm-doom from TOS.

Regards,

/Joakim

You forget that I sold 330 CT1 and 242 CT2 accelerators before !
Some people do not need more than CT2 or CT1...
I sold CT60 to people that have not a CT2 except 1 or 2 people...

But how CT1 + CT2 are yet in use..??

If 6000 F30 are yet in use, they are 6000 that are sleeping somewhere !!
Where are these falcons ? Hey so many people are looking for them...it may
be good to locate some not used falcon !
No falcon on ebay....
Very strange...

Awwww >:D< . Can quite believe it though. It's summed up in one simple phrase, "People talk $hite," and "People are $hits." I
grew up thinking we were making the world a better place, and believed it, HA!! A bit of me still believes it, hence I wrote the
document. Was for me, and you, for you for giving me the pointers in the right direction. Was the least I could do to give
something good back. Trying to lead by example, despite being worn down a bit over the years I still believe I can make 1 ounce of
difference. Perhaps I've made it for you, or someone else browsing out there.

I'll do it :-) when I get round to it. But plenty of docs already out there on the hack sites. Alot are a bit bodgy though. The one I'm trying to get my head round is the ACSI hard disk protocols. I'm still convinced it can be done with a single 20Mhz PIC microcontroller and a CF card though. Is all TTL so can do everything in RISC assembler, been thinking about it quite a bit lately.
Still stuck on the hand shaking though. Without a hard disk to learn from is a bit tricky as I'd analyse the comms going back n forth. Waffle-waffle :-)

Ah, the nice thing about doing it in PIC microcode is that the chip can be protected, with a little bit of traditional hacking/encyption/relocating code too. <vbg>

> Even if I did I would probably get flamed for it.. thats how

Yes, totally support you there. Is the reason why I don't admit to anyone that I know anything about computers, they always expect your time, effort, and for you to take pride in your work, for nothing. "Oh you could make loads sorting out people's PCs." Been there, done that. Enjoy the work and challenges, don't enjoy being poor and treated like I'm pulling a fast one. Being given countless Amstrad 1640 PCs is just an insult. And I'm meant to be grateful for that!?! What the ell do they think I'm gonna do with it ...take it down the local rubbish dump for em.

> my final word on it all was sent to the guy at UCM a while ago, in fact I
> wrote a few thing in there about people flaming me when all I did was help
> ppl.... the friendly group isn't so friendly anymore im affraid :-(

Sounds like the old MCSE newsgroup back in the late 1990's. And then when the $hit hits the fan and things turn real nasty, people look around and say, "Why, what did we do wrong?"

> Chrsi
>

Aly :-)

I guess from the standpoint of anything that takes away from use of our Ataris, then you have a point.

I suppose my anti-MS anything bias is showing. I loathe everything about them. Having used MINT on my first Falcon years before, it was a natural step for me to progress to Linux, rather than Windows.

Linux is much more in line of what my definition of what computing is supposed to be like and about. MS="bad" in my book, and no one will ever convince me otherwise. :-)

See ya!

I don't know why, but some people request now some CT63 and I have no more...
It is maybe the "100MHz effect" ;-)

So I opened a waiting list for an hypthetical next production.

There are 6 boards in this list and I need at least 40 !

So, if you want one...

I agree with you on this - its why all 3 of the Linux boxes in my home LAN
use AMD CPUs... :-)

Why not a CT63 with mb boost? The its only a few more parts and the board is ready?

Either way, I would be interested...

> SDL results in �Video not found� at startup

2 reasons for this:
- not enough ST RAM to allocate screens.

- if using GEM driver, you're not in 256 or true colour mode.

> the screen turns black after a random time if I don't deactivate
> CentScreen (I tried to deactivate the screen saving feature only, but it
> didn't make any difference), and the game crashes when quitting.

It seems the screensaver is reenabled if I select a video mode where it is
enabled. Disabling it in Centscreen only disable for current video mode.
More work needed for this in SDL.

> Maybe an audio problem with 25 MHz MBs only ?

People with audio problems under MiNT, try this under various configs:
http://membres.lycos.fr/pmandin/download/audio.zip
(it plays the given wav file for 5 seconds, then quit).

I didn't read the text properly and your punctuation here is entirely correct :-)

The others I mention are definitely not required as there is no possession or contraction :-)

Thanks Derryck :-) You were quite nice about it, such that the changes have gone into the final version. It was ultimately dreaded that it would be flamed in newsgroup style.

Actually overall this thread has been quite different really. Really upset me today reading NetOps suggestion that I'm a guy. Maybe in a past life, but got me down a bit. Looked at my photos, had a little sleep, argued a bit with my partner. Have perhaps wondered if I should curtail my writing style slightly, but am definitely assertive in real life so not sure what I'm putting

across. :-(I just like playing with my Atari ST, it's mostly free, it's hobby based, and just nice that those electronics skills
I started when I was a child are finally starting to produce some results. Have allsorts here; a Multisync monitor with a
Colour/Mono switching box, floppy disk drives with 3-4foot cables using lower capacitance leads, LCD Cubase setup on the way. All
that stuff I wish I'd known when I was 14-15 years old which I can now do now, perhaps it's age and a little bit of maturity and
patience that make it all work.

All smiles, Aly :-)

The charm of atari is that all the support comes from users and not the corporation. That is what makes the atari community so special.

IMHO--

techie_alison2000@yahoo.com said:

>OK, to add a further twist to the story, I've now just had a phone call back that it's actually correct to use a ' when> something
>belongs to someone or something. Thus, "The ST's RAM banks are full," is correct usage as opposed to, "The STs RAM ban>ks are full."

That's generally correct - it's called a 'possessive'. But an
apostrophe is also used when a part of a word is left out, like
here "that's" is short for "that is" and "it's" for "it is".
Actually, this often causes problems for people, because the word
"its" in the sense "its RAM banks are full" is an exception -
though it acts like a possessive, it doesn't get an apostrophe!
Only when "it's" means "it is" is the apostrophe inserted.

BTW, can you do something about your line lengths in your posts
please - they do not wrap correctly in some mailers as will be
clear from the "quote" chevron in the first two lines. Normally
the RFCs require line lengths of 70 - 72 chars. Thanks!

Regards, /Peter/

I thinks it's more than that - certainly I use mine daily and I
know other club members who do the same (one of them bought a
CT60). In my case I was tempted, but didn't want to recase my
Falcon or hang on an external PS. It's so nice and compact at
present, even with an internal 6.4 GB drive!

I have heard that the usage is now depricated, but once upon a time
you make numerals and groups of letters plural by adding apostrophe "s".
Like this:

In the 1980's, there were more A's in sentences than Z's.

```

looking forward to reading this - I always thought that the history of the Tramiels vs. Irving Gould (one third of the "Three Stooges" that ran Commodore into the ground) would make a good book.

You can't. You put forth money and hope for the best.

> Ie I gave up on atari and have been suffering with frankenstein 200Mhz
> Windows crap crap and currently fortunate enough to be running an 800Mhz
> supermac running OS 9.1 (virtually no support from apple).
>

I don't know any computer that looks more like a Frankenstein than my falcon, but as it boots up I remember that I don't care because it's really really fast.

The CT60 is 100MHz because of a recent 68060 run that is more accepting of overclocking.

As far as getting a CT60 is concerned, you most likely missed the boat. Sorry :-/

Even if you wanted one, guessing you were in the US, Falcon's go for $400-500, CT60 goes for $250 or something, the "special" mask of 060 runs another $100 and we're not even getting into hard drives. If you're using a 200 MHz!!!!! windows machine or 800 MHz supermac (if only I knew what that is), you must have some financial issues.

The CT60 suffers the same problems as other accelerators do - same slow bus - that's why CT60 users can't wait for things that latch onto the new bus like the Supervidel.

Thanks,
Mark

Fidel-Sebastian Hunrichse-Lara a �crit :

>> I'm close to finish my PDF reader.

> MINT only? Or did you as well support TOS/MagiC?

It's a zview's codecs not a standalone application.

For the Requirements, look at here:

http://the.zorro.free.fr/zview.html

But keep in mind than due at the G++ bug, the next version will be only useable if you own a FPU.

So, not suitable for MagiCMac or MagiCPC.

Ciao,
Zorro

With CT60 and 25MHz bus, the scsi gets errors for me on writes. So I only read from scsi devices ;-)

Thanks,
Mark

Rory McMahon, who is a member of SCAT (as am I), is the man to contact. He took over the ethernet hardware that connects through the cart port. The SCAT webpage URL is below. Just go to the members list. I have this setup on my STe and it works great.

You could look for a Reibl or PAMs VME ethernet card on Ebay. I dont
know if they work well with Sting/TOS, but I have one running perfectly
with MiNT.

Coda.

I use since a couple of years a MC68040 with internal FPU...

> So, not suitable for MagiCMac or MagiCPC.

Why? If something runs under MagiC it normally allways run under my MM
v6.1.5! Did you test for _CPU- or for MgMc-Cookie? *MgMc != 68020-CPU*

Hmm, I was just wondering, how many Falcons were sold world-wide? I would have thought (hoped) that the number of Falcon users who upgraded to this once in a life-time opportunity would have been much greater.

Thanks.

First of all, please explain to me how comp.sys.atari.st is political?

2nd, if its just advertising (which is what I do with my .sig, yet its NON political), then you don't need the obviously biased George W. Bush statement in it, do you?

Lastly, if my .sig was political and offensive to some, and they requested that it be changed, I would very seriously consider changing it. I once had a much larger .sig (anyone remember the very first .sig I used years ago here? <grin>) and others here let me know that 4 lines or so was considered a polite limit. I changed it per their request.

Its common courtesy.

As I already told Patrice, this version will now run even if I don't
specify "-audio off". However, sound is coming out very crackled up and
distorted. Almost sounding like signed/unsigned mixup at times.

For the record, this is on a Falcon/CT60 at 100/25mhz running
FreeMiNT/XaAES. How about the rest of you CT60 users? Anyone else
having probs with the sound in Doom in 0.44?

Regards,

/Joakim

Sound is bad as you said under FreeMint/N.AES, but works perfectly
under TOS.  I have Falcon/CT60 at 90/25MHz.

> First of all, please explain to me how comp.sys.atari.st is political?

Cause humam is a zoon politicon?

----------------------- <nibble here> ----------------------
Politics is the process and method of making decisions for groups.
Although it is generally applied to governments, politics is also
observed in all human group interactions including corporate,
academic, and religious.

Political science is the study of political behavior and examines the
acquisition and application of power, i.e. the ability to impose one's
will on another.

One theorist, Harold Lasswell, has defined politics as "who gets what,
when, and how."
----------------------- </nibble here> ----------------------

Yes !!! I could hear .... something. Seems to me that the sound is
overdriven. I still have the color palette restoring problem on exit.
If noone experiences the same, maybe my falcon is sick :(

much greater ??
I'd like because I would be rich now ! ;-)

Maybe if I'd try to do a better price, it may be more attractive...?

Number of falcons in the world : around 10.000 to 12.000 + 1.000 to 2.000 from C-LAB after.
The complete PCB product from atari corp was 20.000, but only 12.000 were assembled and put in the market pipe.
The other 8.000 were sent partially or totally to C-LAB (2 big cargo airflights from Sunnyvale to Germany it was told to me !) : it is why C-LAB do not modify the PCB (even it was urgent to do it : put a SIMM socket on the mb to avoid the ram card by example !!) for MK1/2/X machines--> they have to sold the atari PCB !

That's now an old story and we should show at the future, not the past !

I really don't think there was anything wrong with the price. I for one
feel like I got a high quality item for my money.

Perhaps what I was trying to say didn't come across to well (lost in
translation?). Anyways, I guess we should consider out of those 12,000 how
many are still in use today. Anyone have any idea about that? If just

half, say 6000 were in working order today, it still seems to me that more
Falcon owners would have wanted to upgrade their machines. More than 287.

I'm just saying that seems like a low percentage. :-(

100-150 maybe? With term "in use" i understand Falcon is used on daily base, not to be put out of closet once per month to play some games which dont work in emulator :)

Hey SWE! :-)

Gosh, that just seems plain sad, ya know?

I'd have to honestly say that every Atari system I've got, Lynx, Jaguar, Mega ST (running my BBS), and my Falcon (once I get it back together) get used daily.

I hadn't realized that the Falcon side of the community had dropped that
low. I figured if anything, that higher end machines like the Falcons, TTs
and clones would be used *more*.

LOL, hiya Derryck ;-)

Have just checked up on this and guess what? You're totally right. :-)))

> Needs the http:// in front of that link to conform with the other URLs
> in this section?

DEFINITELY agree with that one ;-) Sorry Chris, looks like we're onto the next version.

>

No worries, not taken as any. :-) I think the trouble with this world, and particularly the Internet, is that we should be using
it to better ourselves, not to argue and read into things that aren't there.
Soooo, in total agreement with you. The system's
working, ..at last.

All now updated in v1.03 at http://www.retro.dial.pipex.com/stram/txt/mem.txt
Next quirk is to get the html to action the .txt as a
download so that it wraps the screen.

Thanks again,

Aly

ps. and for that you get a sneak preview. Call me an exhibitionist; http://uk.profiles.yahoo.com/alyssa_yc

This sounds pretty much identical to the probs I am seeing here -
sounds are distorted, and when the prg crashes upon exiting the palette
is not restored.

My setup is Falcon/CT60 running MiNT/XaAES at 100/25mhz.

I will try and see if I can find out more about the crash at
termination.

Regards,

Joakim

OK, to add a further twist to the story, I've now just had a phone call back that it's actually correct to use a ' when something belongs to someone or something. Thus, "The ST's RAM banks are full," is correct usage as opposed to, "The STs RAM banks are full."

Mmmm, we need the supreme leader of the apostrophe police to help us here. I'd always believed that if something belonged to someone then it gained an apostrophe when referring to it.

Reeeeeaaallly confused here. Help!! I'll look into this one over the next few days otherwise leave it as it is now without the apostrophes. If someone connects the A0 line to the D0 line, now that's a little more critical.

For color palette problem, did you use gem driver (in window) or xbios driver?

Also, try also under tos, to check if audio is ok.

Oh wow, well cool. :-) If by the stroke of midnight tonight this apostrophe thing hasn't been cleared up then I'll do a rollback
to 1.02 to bring it into line with your .pdf.

Okies, brill, will make the revision tonight sitting on retro the final one. Have also managed to dig out another scan from ST
Format with the different mothboard revisions on it, image6, http://www.retro.dial.pipex.com/stram/

Going to try to confirm this apostrophe thing..

http://euclid.colorado.edu/~rmg/its.html
Peter Cassidy supplies another advanced guide:
It's is not, it isn't ain't, and it's it's, not its, if you mean it is. If you don't, it's its. Then too, it's hers. It isn't her's.
It isn't our's either. It's ours, and likewise yours and theirs. [Oxford University Press, Edpress News]

http://owl.english.purdue.edu/handouts/grammar/g_apost.html
Forming possessives of nouns
To see if you need to make a possessive, turn the phrase around and make it an "of the..." phrase. For example:

the boy's hat = the hat of the boy
three days' journey = journey of three days

http://www.pcrrn.co.uk/apostrophe/page2.htm (contradictions on this one..)
English is a living language, and all such languages contain irregularities. One which is relevant to apostrophe usage is it's and
its. It's is short for it is or it has as you see in the table above. Its means belonging to it, as in "It's probably spun off its
neck by now". If you are uncertain which to use, say it in full, e.g. "The world spins on it is axis" is plainly silly, so one
should use its rather than it's

People sometimes get confused when a singular noun ends in the letter 's'. Because of that 's', panic sets in and people wonder which rule to apply. But remember, there is only one rule. Use it.

In the case of a book belonging to Cassius, we will use the 'Chaucer' rule to place the apostrophe.

  Pretend Chaucer Modern correct form
Cassiuss book Cassiuses book Cassius's book

Just apply the rule and the apostrophe will end up in the correct place. This clearly demonstrates that Cassius is singular, i.e.
there is just one Cassius we are talking about, and he possesses the book.

http://www.wonderfulwritingskillsunhandbook.com/html/apostrophe.html
??

http://www.askoxford.com/asktheexperts/faq/aboutgrammar/apostrophe
The word its means 'belonging to it' (as in hold its head still while I jump on its back). It is a possessive pronoun like his.

Mmmmmmmmm, very tempted to go with the Oxford Dictionary here. Which means Derryck is indeed correct. It's its, not it's, when
describing something belonging to somebody or an entity. Trouble is that half these websites say to use it's, and the other half
say to use its. This is more difficult than assembler!!

Right!! That's it!! It's a possessive pronoun, Oxford said so!! Not that Oxford know anything, it's a complete dump. Cambridge
here..

IT'S CAN ONLY MEAN ONE THING, "IT IS."

But .. http://www.lessontutor.com/eesapostrophe.html
5. Use an apostrophe to show possession.

Example:
That is Sandra's book.
NOTE: You usually have a noun after the word that shows possession. Before you use the apostrophe, stop and ask yourself if there is
a word in that sentence that denotes something belonging to someone. If not, then rethink using an apostrophe.

DERRYRK??? Help!! :-)

Ok, I have tested under TOS now, and had some interesting results:

1) The sound is indeed 100% okay under TOS
2) The gfx pallette is not correct under TOS (While it looked fully
okay under MiNT/XaAES)
3) Even under TOS, Doom will crash when user selects "Quit" from menu.
It does not matter whether "audio" off is set or not.

Regards,

/Joakim

Geez, why don't they do like I did (and I'm sure others have)? Avoid the

"Evil Empire" and go with Linux! :-)

That way you can have modern, up-to-date stuff and still support our Atari addiction. :-)

I'm interested in tracking down a copy of an old educational software program for the ST called Geography Tutor from ASDE. Specifically I am interested in version 3 or higher of the main program and/or any of the optional data disks for the program. Please e-mail me at lener@vt.edu if you are in the US and have a copy you would like to sell or trade for. Thanks.

 Hm in what way Linux is less dark? From Atari point of view any non using of
Ataris, etc is bad. Windows, Linux, Mac? If person sell or put Atari in closet
none of them is any good. Using Linux instead Windows is just an excuse :)

Yes agreed, am totally bored of it and wound up now. Have asked a P.C. newsgroup I thought could help to confirm it and instead of addressing it, I'm getting flamed by some batty middle aged house wife on use of English in technical documents.

Final revision is v1.03 on there now.

Sound sounds fine here, on my 100/20 MHz FalCT60.
However, trying to use SDL results in �Video not found� at startup, the
screen turns black after a random time if I don't deactivate CentScreen
(I tried to deactivate the screen saving feature only, but it didn't
make any difference), and the game crashes when quitting.
>

Maybe an audio problem with 25 MHz MBs only ?

Aren't emulators as well designed to run Atari software?

> If you added a K6-III upgrade to a 286 motherboard, you would still
> consider it to be a PC I presume....?

Sure! A PC with AMD K6-III-Upgradeboard... but 286 motherboards
normaly use Intel-CPUs & Ataris use MC68000 or MC68030 - everything
else is a form of upgrade.

There's finaly no difference between CT60, compatible hardware or
emulated/virtual hardware... they're all Atari-upgrade-varieties!

You can upgrade a Mega ST or Mega STe which use 68000s to 68030s, so do
you think these are still Atari machines? They are both Motorola CPUs.

Furthering that point, the CT60 uses a *Motorola* 68060 chip. So..ergo, if
you upgrade a Mega to a 680030, and its still an Atari, then a Falcon with
a 68060 is still an Atari.  :-)

> There's finaly no difference between CT60, compatible hardware or

Thats your opinion, and you're entitled to it of course. Just don't act
surprised when people disagree with you.

I do not think that Atari OS/hardware "emulated" on a different machine
architecture is the same as an Atari OS running on Atari hardware.

Please note that I'm *not* saying that emulation is bad, I just don't
```

think its the same.

Personally, I'm impressed as can be with ARAnyM, I think its an incredible effort. I even downloaded the stand-alone ISO, burnt it to CD and can now boot up to an emulated Atari environment on my Dell/Linux laptop. Impressess the heck out of me everytime I do it. :-)

As good as it is, and there's no doubt its getting better, all I have to do is turn my head and look at the machine setting next to it. A real Atari OS running on real Atari hardware. There's no doubt, IMHO, which is which.

Just my 2 cents worth. ;-)

Ah, but it only applys for the Tramiel erra. And consoles don't count,
but how much ram does a TT030 and Stacey have then;-)

I have read the ST FAQ but they don't help much. The more detailed
instructions they refer to (sony_144.zip) isn't to be found anywhere.

Can anyone help me connect a Sony floppy drive to to 1040 STE (and get
it working)?

Thanks

Ric

>
>Aren't emulators as well designed to run Atari software?

If you look in the text I wrote earlier I said "fastest hardware
available that was designed to run Atari software". The emulator is
designed to run Atari software yes, but the *hardware* that the
emulator is ran on is not. Hence why it is true that a Falcon with a
CT60 is the fastest *Atari hardware setup* available, when we are

talking about the Atari compatible hardware. Ok?

>>There's finaly no difference between CT60, compatible hardware or
>>emulated/virtual hardware... they're all Atari-upgrade-varieties!

As Ronald already pointed out, that is your opinion. And don't be
surprised when some people, like me, chose to think differently on this
subject ;)

Just typed "sony_144.zip" into Google?

2nd one down, on the Atari Hardware Hack Page. http://atari4ever.free.fr/
hardware/drives.html Is for an MPF-520 anyhow, not the
current 920's.

I'd be tempted to suggest that you pick up an already modded one from Chris at CPS; http://www.cps-electronics.co.uk/144/HD4.htm .
At �15 is good value for money seeing as the price on the street is �10 for a stock Sony FDD. Also, should you end up with revision
or something, the likes of PC World and most computer shops wouldn't have a clue what you're talking about, neither would they care
or refund the unit if unmoddable. Have been here before on this one, the stuff on the high street is mass produced cr@p. Current
PC FDD's are not industry standard Shugart drives in the traditional sense.

Another direction to take would be to research into how people with Yamaha music keyboards and alike do it, there's quite a bit of
info out there in other arenas. The problem again, getting hold of the drives to do the mods on. Grab one from CPS.

Well Mac and Amiga also uses same CPU and they are not Ataris. But i agree with you here, would just expand that: If one replace CPU with more powerfull CPU, and machine use the rest of hardware as it did before (kinda like tunning the car's engine) thats basicaly same machine. Using emulation and similar is not. Best example is new WV beetle. NONE of old fans accept is as real VW beetle, its just WV Golf with fancy look.

Iys definately not the same. WHY emulation users defends themselves (as we didnt say using emu (good one) or compatible is bad) is beyond me. That fact alone, proves, that using original HW is DIFFERENT :)))

Hey gang, I have a question...will the Sony drive in question here match up with the STs drive face?

I guess I'm asking if you have to hack 'n mod the drive opening to accomodate the drive itself.

I wouldn't mind eventually having a 1.44 drive in my Mega ST but I sure wouldn't want to mess up its looks.

Thanks.

> then a Falcon with a 68060 is still an Atari.

Did Atari ever build MC68060 machines? AFAIK they only manufacture
some MC68040 prototypes...

> Just don't act surprised when people disagree with you.

I'm not surprised, everywhere exist fundamentalist...

> I do not think that Atari OS/hardware "emulated" on a different machine
> architecture is the same as an Atari OS running on Atari hardware.

Is the CT60 not as well a different machine architecture? And do you
really use an original Atari OS? IMHO only the TOS/GEM software makes
the difference... & not the hardware!

> boot up to an emulated Atari environment on my Dell/Linux laptop.

I favor 68k-Macs - fast enough & old enough... that's pure nostalgia!

CT60 is CPU upgrade: ALL Falcon systems (bus, videl, etc) are still in use, same as u tune engine of the car....

>> Just don't act surprised when people disagree with you.

This is stupid. U use a PC, with Windows and run Magic PC then. Let me ask you this: how come, that your "ATARI" will be brought down by a PC virus? My Atari surely will not be knocked down by PC/MAC/Linux attack.

Hmm...if I'm reading this right though, you could leave the internal drive the same and just have an external 1.44? That would work for me. :-)

Right. Different CPU, with a "daughterboard" added.

> Did Atari ever build MC68060 machines? AFAIK they only manufacture
> some MC68040 prototypes...

In effect, you're trying to say that if Atari didn't manufacture it
themselves, and you add it to any Atari machine, that its no longer an
Atari Machine? That is some really, really odd thinking there friend.

So what about all those 3rd party add-ons over the years? Seems to me, by
your reckoning, there are no "true" Atari machines left... :-)

>> Just don't act surprised when people disagree with you.
>
> I'm not surprised, everywhere exist fundamentalist...

Ever notice how many people are agreeing with you vs how many people are
not agreeing with you? You might want to think about that...

> Is the CT60 not as well a different machine architecture? And do you
> really use an original Atari OS? IMHO only the TOS/GEM software makes
> the difference... & not the hardware!

No. I've added something to an existing Atari setup. Not removed the
entire Atari setup altogether and replaced it. Added...enhanced...not
replaced. See?

When I boot up my CT60 Falcon, I wind up at a TOS 4.04 desktop. Do you disagree? I don't have to run another OS, or another program, to get there.

So in effect what I get is this:

"> Sure! A updated Atari machine..."

via this: "Right. Different CPU, with a "daughterboard" added."

No different in concept than the Mega ST/STe running a 678030. See? :-)

>> boot up to an emulated Atari environment on my Dell/Linux laptop.
>
> I favor 68k-Macs - fast enough & old enough... that's pure nostalgia!
>
> Saluti-gerulus

Not as good a feeling as booting up an 800XL, IMO... ;-)

yup, theres only the drive select which changes for internal/external. Most
people tend to use thier old 720K external with 1.44 internal, but theres no
problem about doing it the other way around.

Chris

Ebuyer have MPF920's for about �4, but then you have to mod it
yourself...

yup, if you are in the right place you can pick up some deals if you look
enough..... though going by the people ive delt with in the past they are
too darn idle to even take the back off a floppy drive, some people even get
the impression that doing such things is "beneath them" which is kinda
depressing also.

A MC68030-CPU or any other part of the hardware on a original Falcon
is designed to run Atari software? I don't think so...

Do you think a fundamentalist will agree another fundamentalist?

> No. I've added something to an existing Atari setup.

And is the CT60-Upgradeboard not a different machine architecture?

> Not removed the entire Atari setup altogether and replaced it.

An Atari-emulator that remove the entire Atari setup is no longer a
Atari-emulator, isn't? ;->

FlightSimBooks.com is a new site that features the full text of eleven
classic flight simulation books.

http://www.FlightSimBooks.com

More than 2,200 printed pages have been digitized into 800+ web pages. The titles available are:

- Jet Fighter School and Jet Fighter School II by Richard G. Sheffield

- Flying on Instruments with Flight Simulator by Jonathan M. Stern

- Learning to Fly with Flight Simulator and Realistic Commercial Flying with Flight Simulator by John Rafferty

- 40 Great Flight Simulator Adventures, 40 More Great Flight Simulator Adventures, Flight Simulator Co-Pilot, Flying Flight Simulator, Runway USA, and A Flight Simulator Odyssey by Charles Gulick

These books, published from 1985-1989, cover Microsoft Flight Simulator and Sublogic Flight Simulator software, plus other flight sim programs including F-15 Strike Eagle and Sublogic's Jet. Users who prefer more modern flight simulators will find that many of the techniques and situations described in these books, such as aerobatic maneuvers and instrument flying techniques, remain relevant to newer flight simulators.

All of the books are available with the gracious permission of their authors.

FlightSimBooks.com was created by Kevin Savetz with help from volunteers. His other classic computing sites include AtariArchives.org, which offers the full text of 30 classic computing books; and Classic Computer Magazine Archive (www.atarimagazines.com), which offers full text of Compute!, Creative Computing, Antic, and other early computer magazines.

Enjoy!
Kevin

Hello,

I think I made big progress this week, as audio drivers seem to be fixed
now. Using sound should not crash anymore.

Also, with this release, texturing on floor/ceiling can be switched off
for faster rendering.

The *Falcon* (or any other Atari computer or hardware clone) is clearly a hardware design that is created for the purpose of running Atari software. It is pretty simple.

Why are you still misunderstanding what it said on purpose? Having opinions is one thing, but if you can't even carry on a normal conversation then it is pointless to reply to you anymore.

Good bye.

/Joakim

Yep,

There really is no need for him to try making an ass out of dubya in
his .sig - he does (or doesnt?) do that on his own, and (just so you
dont think im an anti-American) - so does his puppet, Blair.

Anyway, as a (poor) attempt to keep this topic Atari related - err,
does anyone know if dubya ever played Atari games?

...maybe a bit of missile command? :-P

Well thats my U.S visitor Visa cancelled for the forseeable future.

Coda.

Hi All,

These procedures have been developed over the previous few months with kind assistance of Chris Swinson (Exxos). This is the first posting of these here before they go off onto the forums etc. so that they can be found by other Atari users when web searching for such an upgrade (lots of peeps seem to talk about 4Mb upgrades but no one ever says how, strange that...). It's hoped that any questions or bugs can be addressed and ironed out here with you (the hardcore techies) before it goes out for public release. As for getting it on the various Atari hack websites, most of the contact/webmaster email addy's are dead. This just may be one for the comp.sys faq. Alot of time, effort, and emails back n forth have gone into this so please don't be too harsh. :-)

Thanks for any assistance you can provide. It currently sits here temporarily; http://www.retro.dial.pipex.com/ . Here it comes..

"

Atari ST 72-pin SIMM Memory Upgrade - July 22nd 2005 - v1.02

0. Introduction
1. The signal lines
2. 16pin 41256 DRAM pinouts
3. 72pin 4Mb SIMM pinouts
4. Building a test-bed to identify 'good' SIMMS
5. Preparing the Atari ST for connection to your SIMM
6. Connecting your SIMM socket to the ST's motherboard.
7. Hardwiring a chosen SIMM to the motherboard
8. Hints and Tips
9. Adding a toggle switch for 4Mb or 1Mb operation
10. RAM testing programs
11. Final note
12. More notes
13. Some images at a web address
14. Static precautions
15. Credits

0. Introduction

These procedures are written to roughly describe the procedure of upgrading the memory of the Atari 520ST or 1040ST to 4Mb. This is achieved by utilising a single 72-pin SIMM memory stick and wiring it in to replace the existing ram. All connections are made directly to the ram banks. There is some soldering involved, well, there's actually quite alot of very delicate soldering involved, especially on the SIMM. If your machine has 16 or 32 RAM chips then this is for you. The procedures are also suitable for other machines if you put your mind to it.

As a disclaimer (we're seeing alot more these days aren't we!) it has to be said that you're on your own. If you blow up your computer or electrocute the cat when it sits on the open power supply, then don't say you weren't warned of what could happen. Use your common sense. If the steps are too steep then look where you're going. This procedure does work and has been used numerous times before releasing here in written form with our names on the bottom. Best of luck.

1. The signal lines

There are three main groups of signal lines. D0 thru D15 refer to what would be the individual chip selection lines, if there are 16 chips as there are in the Atari ST, then there are 16 individual chip select lines. A0 thru A8 are the address lines, by looking at how many of these you can determine how much RAM the machine can physically address. In the standard ST configuration a maximum of 512K can be utilised from 16 chips, or 1024k if 32 are used. If now the A9 address line is enabled (as it will be later) then we can address 4Mbytes.

The other lines are the row and column strobes, RAS, CAS etc. Memory by it's design loses the information it contains after a short while, these signals are used to refresh these values periodically, this is all done automatically by the memory controller. Remember the various settings in an IBM PC compatible's BIOS for setting these? RAS/CAS delay etc.

Finally the last group are straightforward. GND and +5v provide power to the memory. The WE signal line tells the chips if they should be receiving or sending data, WE is sort of on it's own as far as signals go, it's not a D or A line, and it's not a RAS/CAS select line. If it had to be grouped then it could be put with the RAS/CAS lines although it is quite different.

2. 16pin 41256 DRAM pinouts

The pinouts for the chips used in the ST are as follows. Note, some ST's have 8 1Mbit chips and these revisions are not discussed here.

```
      ------\_/------
   A8 |1          16| GND
    D |2          15| CAS
   WE |3          14| Q
  RAS |4          13| A6
   A0 |5          12| A3
   A2 |6          11| A4
   A1 |7          10| A5
  Vcc |8           9| A7
      ---------------
```

3. 72pin 4Mb SIMM pinouts

These are the pinouts for a standard 4Mb 72pin SIMM. On a 1Mbyte SIMM the A9 line is N/C, and on an 8Mbyte SIMM A10 is now present.
The sticks that we are interested in have a minimum of A0 thru A9 enabled.

SIMM	Description
1	GND
2+3	D0 + D16
4+5	D1 + D17
6+7	D2 + D18
8+9	D3 + D19
10	+5v
12	A0
13	A1
14	A2
15	A3
16	A4
17	A5
18	A6
20+21	D4 + D20
22+23	D5 + D21
24+25	D6 + D22
26+27	D7 + D23
28	A7
30	+5v
31	A8
32	A9
34	RAS1
39	GND
40	CAS0L
41	CAS1L
42	CAS1H
43	CAS0H
44	RAS0
47	WE
49+50	D8 + D24
51+52	D9 + D25
53+54	D10 + D26
55+56	D11 + D27
57+58	D12 + D28
59	+5v
60+61	D13 + D29
62+63	D14 + D30
64+65	D15 + D31

72 GND

==========================

*40 connections to be made

==========================

a. A0 thru A9 are the address lines
b. D0 thru D32 are the data/chip lines
c. CAS0L thru CAS1H are the column select lines
d. RAS0 and RAS1 are the row select lines
e. WE is the Write Enable line
f. GND and +5v are the power supply for the SIMM board

4. Building a test-bed to identify 'good' SIMMS

It may be an idea to test your SIMMs in a socket first. This is discussed in the following paragraphs.

Probably one of the most important aspects here is to have SIMM memory which is actually suitable for the job. SIMMS generally come in two flavours, EDO and FP. EDO ram is optimised to allow faster access times and is unsuitable for the Atari ST. FP or Fast Page ram is required, and as a percentage, EDO ram is more available than FP ram to about 75%, or, a ratio of 3:1. Thus, you will need to build a test bed first to test your SIMMS prior to any permanent fitting.

A 72-pin SIMM socket is required, these are commonly found on 486 and some early Pentium motherboards. The method for removing these is to take a butane blow torch to the back of the board and carefully remove the socket, this totally destroys the donor motherboard so you may as well remove all of the sockets, likely 4 off.

Having removed your now slightly charred sockets, wires now need to be soldered to the 'very' small solder pins on the back.
Recommended materials are suggested;
 a. Heat-shrink to seal the connections afterwards
 b. 10 6inch lengths of solid core wire for address lines
 c. 16 6inch lengths of solid core wire for data/chip lines
 d. 32 1inch lengths of SCW for data/chip lines
 d. 3 6inch lengths of SCW for ground lines
 e. 3 6inch lengths of SCW for +5v lines
 f. 6 6inch lengths of SCW for row/column select lines
 g. 1 6inch length of SCW for WE line

It is suggested that your data/chip lines be hooked up first. There are 16 connections to be made to the ST board, coming from 32 connections on the SIMM. So.. solder your 32 1inch lengths to the data lines on the SIMM socket, afterwards heat shrink these where they connect, about 5mm of heat shrink each. It is further suggested to strip these wires to about 3mm before you begin. Next, the 32 bits of wire you have poking out from the socket need to be paired up and soldered to your 16 6inch lengths. These connections will also need to be heatshrinked. That's the data lines done!! Expected time to do this is about 1-2 hours.

All of the other lines to be connected to the SIMM socket are made singlely so is quite straight forward here after. All should be individually heat shrinked where the connection is made on the back of the socket also.

5. Preparing the Atari ST for connection to your SIMM

Unfortunately you cannot just make the connections to the various points on the ST's existing DRAM banks as the existing dram will interfere with the signals. There are a number of ways to deal with this;

a. Remove ALL of the dram chips from the ST's motherboard.
b. Disable power and RAS/CAS signals to the dram chips, leaving them in place

Performing (a) is probably the best course of action. Salvaging the existing chips will be difficult however, as potentially expensive and damaging methods are required to get those chips off of the board in one piece. The method here was to use a hobby drill with a cutting disc fitted and to cut the legs off of every chip, finally removing the remaining 'stumps' from the motherboard.

Performing (b) has the advantage that your dram chips are preserved should you ever wish to downgrade and it's less stressful. Disabling power to the chips can be achieved by lifting the inductor L51 just next to the main power connector to the motherboard. This procedure is not however guaranteed as many revisions of the ST motherboard existed. On my test motherboard the power area where L51 forms a circuit also powers the floppy disk drive. Power for the FDD can of course be taken from elsewhere on the board as there may be additional solder points, there are some here directly infront of the main power supply connector. It is only the +5v line which is affected for the FDD, which is the red wire. The existing dram signals that you must disable are RAS0, CAS0L, CAS1L; That's the main bank in 520STFM models. On 1040STFM models or 520ST's with 1Mbyte upgrades, RAS1, CAS1L and CAS1H must also be disabled. This is achieved by lifting the 66ohm resistors R59, R60 and R61 for bank0, and R71, R72, R73 for bank1. If you do not do this then you will be looking at a blank screen when you power-up. It is also debatable as to whether the +5v actually needs to be disabled to the RAM banks, but since the ST's PSU is generally quite small, it makes good practice either way.

Please note again that as there are many revisions of the ST board, such that procedure (a) can only be suggested as solid guidance. In an ideal world I would always choose (a) since you simply do not know how those existing dram chips will interfere with the other signal lines.

The next stage is to bring out the A9 signal line. You have to make a connection directly to pin64 of the MMU chip to bring this line out for use. Suggested procedure for this is to drill a hole through the ST motherboard and to place a PCB pin to the upper side which connects to the pin64 solder joint on the underside of the board. The tricky bit there is finding somewhere for your hole on the ST motherboard where no tracks are running. Space is tight, VERY tight. The PCB pin here was placed just behind the main power supply connector with barely 1mm spare around it, and a wire taken between the two points on the underside. There's also another space just infront of the bank of resistors. You can identify pin64 with a multimeter, pin61 is labelled topside. (if you don't know how to do this then you shouldn't even be doing it!) Having brought out A9, a 33ohm resistor will required in series to A9 on the SIMM. This can be soldered straight to the PCB pin.

6. Connecting your SIMM socket to the ST's motherboard.

a. Make the D0 thru D15 connections first, these connect to one of either of the 2 dram banks. D0 for example will connect to the space for dram chip U47 at pin 2. D1 to U42 at pin 2. Here's a list;
U47/pin2 > D0
U42/pin2 > D1
U37/pin2 > D2
U30/pin2 > D3
U25/pin2 > D4
U21/pin2 > D5
U13/pin2 > D6
U6/pin2 > D7

U46/pin2 > D8
U41/pin2 > D9
U36/pin2 > D10
U29/pin2 > D11
U24/pin2 > D12
U20/pin2 > D13
U12/pin2 > D14
U5/pin2 > D15

b. Now make the A0 thru A9 connections. It is suggested that these are made directly to the resistor bank below the dram banks and above the MMU. The resistors in this bank do the following;
R59 > RAS0
R60 > CAS0L
R61 > CAS1L
R62 > A8
R63 > A7
R64 > A6
R65 > A0
R66 > A1
R67 > A2
R68 > A3
R69 > A4

R70 > A5
R71 > CAS1H
R72 > CAS1L
R73 > RAS1
MMU64 > A9

c. The row and column address signals are made as per the information table supplied in (b) above. It is probably easier to make these connections directly to the resistors rather than to the dram sockets if empty. If your RAM does remain then you need to lift up the RAS/CAS buffer resistors to separate the signals from the existing RAM.

d. WE (Write Enable) has to be connected to pin3 of any of the vacant dram spaces where the dram would be located. If you're leaving the existing dram in then just solder to pin3 of any of the chips.

e. The SIMM's power is supplied from the motherboard. There are 2 methods here to get power. If you have removed all of your dram chips and L51 is still in place then you may take power from the dram sockets, pin8 is +5v and pin16 is GND. More than one take off is recommended to source sufficiant power for the SIMM.

If your existing dram remains and you have lifted up L51 then you need to find power from somewhere else other than the dram area. The pin16/GND's will still be connected at the dram sockets although your +5v will need to be taken straight from L51. L51 seems the obvious choice although I am concerned about sufficient smoothing being lost as the capacitors within the dram banks are no longer part of the circuit. To be revised, this procedure is to be tested on my next memory upgrade.

REVISION: 1040ST system with both banks fitted and disabled seems to be functioning well. +5v for the SIMM is taken from the lifted L51. The +5v for the FDD is routed from the empty FDD pad bank located in front of the main PSU connector, the +5v/RED wire has been extended to accommodate. The RAS/CAS resistors have been lifted and laid back down onto insulating tape beneath them.

7. Hardwiring a chosen SIMM to the motherboard

At your discression. A hardwired SIMM does fit nicely on top of the first bank though. Is also an idea to have the wires running across the back of the SIMM board rather than simply away from it, as they can be taped down to the board to provide strength.

8. Hints and Tips

The motherboard that has just been worked on with the 2 banks of ram remaining had had it's 2nd bank bodge fitted by a previous owner (eBay purchase). Tracks on this motherboard were damaged and the standard of soldering was lumpy, it is surprising that the

SIMM upgrade did not upset things so the dram was chosen to be left in place with the minimum of upset. The first piece of advice follows;
*Take pride and time in your work
*Plan out each job separately
*Aim to take 2-3days on-and-off to complete this upgrade
*Before even starting, get some magnifying goggles
*Prepare your test SIMM socket first, test for shorts with a multimeter
*Fit your A9 pin as a separate job, use a small manual hand drill and not your Dad's hammer action drill
*Grinding off your ram is a separate job, and don't go through any tracks!!
*Removing the ram stumps is a separate job
*Bringing up L51, R59, R60, R61, R71, R72, R73 is only just a separate job, tea time!!

Having the right tools is another requirement for this job;
*18w soldering iron with a brand new small tip
*Magnifying goggles (already mentioned)
*Multimeter with diode test facility (or resistance) for shorts
*Long nose tweezers
*Long nose pliers
*Professional jaw wire cutters, expect to spend �10
*Dentist's tools, picks etc. (also sold as soldering tools)
*Helping hands (those things with croc clips for holding things)
*Insulating tape
*Sharp scissors

That's some of the tips I can think of anyway. Oh, one last tip for the wire cutters. You'll notice that stripping wire connected to a delicate board isn't too practical. Grasp your wire with the cutters, and then using the long nosed pliers hold the wire again just behind the jaws of the cutters, then simply lever the cutters against the pliers. This enables the wire to be stripped without bending things and jolting everything.

When you start to test your SIMMS to identify a Fast Page version, it may be difficult to determine if your first SIMM is an EDO or if you have a genuine wiring error. Trust me, I know the anticipation when you switch on for the first time. The effect of inserting an EDO SIMM is that the screen will be corrupted with lots of coloured flecks pulsing across the screen, and, the computer will likely attempt to boot. It may even make it to the desktop, just with coloured flecks all over the place, or it may bomb out.
If you have made a wiring error then it is likely that the screen may be blank, or it may be the case that the screen is filled with solid coloured blocks. Just try another SIMM to see if it behaves the same way, in testing it was found that different brands of EDO SIMMs behaved just slightly differently, a very rare few may even work, it's not known why but two were found here. It is imagined that you will have a box of 20-odd assorted SIMMs to test. If you have sourced two SIMMs from eBay then the chances are that these will be EDO sticks.

Before you switch on for the first time, do check for shorts and wiring errors. It only takes 10 minutes to thoroughly check over for problems.

9. Adding a toggle switch for 4Mb or 1Mb operation

There are bugs! Surprised? No, didn't think you were. Some ST programs, namely games, will not function on a 4Mb machine. This is caused as some misbehaving programs will attempt to address past the 4Mb ceiling, don't ask me why they do this. Anyway, on a 520ST or 1040ST this doesn't cause a great problem as the ST's BIOS simply returns a software-error, it's trapped by the program, and everything carries on running. On a 4Mb machine however, addressing past the 4Mb ceiling creates a hardware-error, which isn't trapped, and the system crashes. End of story.

When writing these procedures it was decided to try to turn our 4Mb machine back into a 1Mb machine at the flick of a switch. Interested?

A 2-pole switch was fitted at the back of the machine through the case, in the area between the PSU and FDD shielding. The A9 signal which runs from the SIMM is common (in the middle), with GND and the MMU A9 signal being selectable. In one position the SIMM's A9 is connected to the MMU's A9 as per this document. In the other position, the SIMM's A9 is grounded. It's as simple as that! Connecting the SIMM's A9 signal to ground turns our machine into a 1040ST. It is ok to leave the MMU's A9 floating, as it has been for years since it left the factory.

If you should be tempted to try switching while the machine is switched on, it doesn't work, obviously. By all means, switch between 4Mb and 1Mb with the machine powered although I don't know if this could destroy the SIMM or MMU. What has been tried here is to switch over and then perform a reset, which seems to work ok aside from the screen corruption. On your head be it!

10. RAM testing programs

Having completed this RAM upgrade and with a gleaming desktop you of course want to thoroughly test everything. Two pieces of software have been identified as being suitable.

Peter Knoppers, a hardened techie from Holland, has kindly allowed us to link to his ramtest program found here; http://ce.et.tudelft.nl/~knop/#memorytest . The one thing to mention about his software is that you have to output to either a parallel printer connected to the ST, alternatively, you can output via the serial port, connecting this to a PC running HyperTerminal with a NULL modem cable. His software is VERY configurable, so if you have a NULL modem cable then he's well worth a look. I quite like the software as it leaves you with a status log should your ST die or something.

Chris Swinson, of CPS electronics in the UK has suggested the MARPET test program now found here;
www.cps-electronics.co.uk/144/ramtest.zip . As far as permission to use the program goes, unsuccessful attempts have been made to contact Marpet thus the package has been deemed abandonware. Unless anyone knows otherwise that is. It's an ok program mind in that it outputs directly to the ST's screen, although in comparison to Peter's offering, it doesn't appear to be so intuitive or thorough, guess that makes it easy to use! I'm not sure if it relocates itself at each run, but of course if you just want output to the screen and to leave the computer testing then it's all thumbs up.

The final method of testing your RAM, as suggested by Chris again, is to create a whopping 3.5Mbyte RAM disk. Create a totally black .BMP image file on your PC, and port it back and forth using the PARCP transfer program. If any errors occur then you will be able to easily identify problems from colours creeping into your bitmap file when viewed again on the PC.

11. Final note

Where you position your final SIMM is up to you. The guidelines provided here are simply to show that it can be done, and roughly how you might do it and to get you started. You could use your socket or you could hard wire. As for where you end up and how you do it, that's all part of the fun and job well done.

12. More notes

To aid completeness it was thought an idea to provide web links to some of the tools and equipment used. Most of this is sourced from Maplin Electronics in the UK who are the equivalent of the Tandy/Radio Shack shops in the USA.

14. Static precautions

We hear more and more about static, almost as often as legal disclaimers. The reality is that static is not always an issue. If you live in a dry non-humid heated climate then yes it certainly is, we've all seen the little blue sparks and heard the crackling on clothes. If however you live in the UK, where it rains constantly then it may not be so much of an issue. I'm saying this here as I've just seen one of the progress photos with SIMM sticks laying all over the carpet. Some environments generate static, others don't. It is however always a risk but the feeling that it is constantly necessary to hook yourself up to the GND's of the National Electricity Grid is a trifle excessive. Once again, just use your common sense of what you know about the environment around you, touch a grounded device occasionally. Oh by the way, the ST's motherboard was always sitting on a newspaper in those photos.

15. Credits

Alison Challis (techie_alison) of Cambridge UK - Author and tester of these procedures

Chris Swinson (Exxos) of somewhere in the UK - original developer of these procedures many years ago, his website is here; cps-electronics.co.uk . Chris has been my mentor here and has provided lots and lots of patience.

Peter Knoppers of Holland - kindly allowed permission to use his ramtest program. It can be found here;
http://ce.et.tudelft.nl/~knop/#memorytest .

Christopher Hicks of Cambridge UK - his 30-pin SIMM/SIPP hack helped immensely. It can be seen here;
http://atari4ever.free.fr/hardware/ram.html .

Geir �yvind V�lidalo of somewhere - his Atari Stacy 4Mb upgrade helped immensely. It can be seen here;
http://atari.nvg.org/stacyram/ .

Kurt Sharp also gets a mention as he's been viewing the pictures of my upgrades with bundles of wire going everywhere and saying Ooh Ahh. Most encouraging. Kurt is in the process of developing a RAM test program so hopefully this will enter the public domain in months to come.

This is just plain STUPID:

1st ATARI may make a lawnmover, running 0 ST/Falcon programs, it is still
an ATARI product. There is not question at all what ATARI had in mind when
designing GLUE, SHIFTER, VIDEL (fact that VIDEL has ST SHIFTER compatible
registers clearly shows they HAD compatibility in mind) as they are the
manufacturer. So 800xl, ST, Falcon, TT, ABAQ, ATARI PC, Lynx, JAG,
Portfolio, VCS and so on are ALL ATARIs (altough not compatible). DELL,
Commodore, whatever are NOT.

2nd U may use emulator on any hardware, thats okay. But hadware running
emulator is NOT emulated machine's native hardware, so no matter what
emulator u run, u use DELL (as i think u said u own DELL). Your Magic_pc is
useless without Windows, so please, stop with this nonsense.

What kind of atari is a CTxx?
I have never had my hands on anything more powerful than an ST.

Like where could I go to see demos of Falcons, TT's and beyond? And can
they run at 100Mhz? (or even faster?)

```
Ie I gave up on atari and have been suffering with frankenstein 200Mhz
Windows crap crap and currently fortunate enough to be running an 800Mhz
supermac running OS 9.1  (virtually no support from apple).

Cheers--

Coda a �crit :

> Yes there is. GCC 3.3. Ask on the mint list.

Currently, I'm close to finish my PDF reader. I have wrote that in C++.

Here my conclusions:

1) The C++ compiler from GCC 3.x.x produces corrupted binaries, nothing to do, it doesn't work :-/

Maybe the problem is not inside the compiler itself but in the initialisation code (crt0.o) or in libstdc++ ?

2) The "good" old G++ 2.96.x is a little bit better but still very buggy with floating point computation; however, when I compile with "-fomit-frame-pointer -m68020 -m68881", the application works like a charm:

http://zorro.arcadia-crew.com/tmp/68881.jpg

When I compile with "-m68020-60", the alpha layer computation are completly wrong:

http://zorro.arcadia-crew.com/tmp/68020-60.jpg

And with "-msoft-float", I have a bus error :/

3) The very old G++ 2.8.x works very well but all the modern C++ codes are not suitable for this compiler, so the problem remains.

Ciao,
Zorro

Find out more about the battle between Atari and Commodore in a new book, "The Spectacular Rise and Fall of Commodore". Learn how former Atari 2600/Atari 800 engineer Jay Miner developed the Amiga computer, and how Atari almost purchased Amiga. Find out how the Atari ST was partially designed by Commodore engineers while they were still at Commodore. Atari founder Nolan Bushnell even joined with Commodore to launch the Commodore CDTV, a precursor to the modern DVD player.

The Spectacular Rise and Fall of Commodore is a detailed history of the company behind the best selling computer system of all time, the Commodore 64. This book was almost two years in the making, using over 44 hours of interviews with Commodore engineers and managers.

Title: The Spectacular Rise and Fall of Commodore: The Inside Story
Pages: 624
Size: 6 x 9 inches
ISBN 0-9738649-0-7
August 2005

Yes, will you please voluntarily remove your obviously political .sig
from an equally obviously NON political newsgroup? (comp.sys.atari.st).

Thank you.

Its an expansion board for the Falcon 030. It uses a Motoroloa 68060 CPU
and allows you to use SDRAM (and lots of it!).

> I have never had my hands on anything more powerful than an ST.

A well-tuned CT60 equipped Falcon is pretty awe-inspiring. :-)

> Like where could I go to see demos of Falcons, TT's and beyond? And can
> they run at 100Mhz? (or even faster?)

Hmm, don't think there are too many demos made just for the CT60 as yet,
but I think they will be.

> Ie I gave up on atari and have been suffering with frankenstein 200Mhz
> Windows crap crap and currently fortunate enough to be running an 800Mhz

Ok I bought another Magnavox RGB 80 Monitor.

It is like my other one in every detail except that it isn't the PRO version.

If it was it would have Magnavox Professional on the front and a Lin RGB Port on the back.

The lin RGB port is the same port thats on the STs/STe/Mega/etc. You can even use the Falcon on it.

It does have the place for the port but theres a round plastic cover over it. Yes I took it off. No Lin Port. I even took the case apart in hopes I could just solder in the port. But there is no circuitry for it.

But it does have the IBM TTL RGB port which is 8 pins Round port almost exactly like the ST lin RBG ex cept it has 6 pins.

I was wondering if anyone made a cable that had the lin RGB 6 pin connector on one end and the 8 pin TTL RGB connector on the other.

If not I want to make my own but I only have one good standard ST RGB cable and I don't want to hack on it.

This monitor and the one I had that broke down both will work on a Atari 8-bit/Commodore.

You can hook both computers up to this monitor at the same time and switch displays by pressing a switch on the front under the door. Pretty Cool.

The one I just bought is like new.

My old one is fixable, but I just haven't had time to get to Radio Shack to pick up the right caps and etc. and theres the time to fix it. I have a 7 years old and until schools back in my time is limited.

I need some standard ST RGB cables any way. The ones with the Round 6pin connector on both ends. Or a few cut off a bad ST monitor as you suggested to make a cable.

Thanks for any help

I have been trying to get the SCUMMVM game engine running on my Milan
(Mint 1.15.12, NAES)

I have discovered that it by running the command "scummvm moneyega"
with the game files in the same folder as scummvm binary then the
game will start !

Unfortunately it gives two messages in the game window but never gets any further. I think the next screen is the security check.

Has anyone made any better progress ?

I did discover that if the game is started with the wrong parameter
such as "scummvm monkey" then it locks the desktop and ctrl-alt-del
is the only cure.

Regards,

Peter

Did you recompile it yourself? Which version did you try?

> like I said, your a pretty funny guy.

Ya know you are on the border line of calling me something that you
better
not.

And If I am wrong, then correct me on what I am wrong about.

>
> I do happen to have an NTSC Expose and splitter as well. The reason I didn't mention it was I got it from another user in this group in non-working condition and I didn't want you hounding me for months on end to trade it for a Spider Man comic book or something.

Thats low of you Mike. I do have a issue of Superman Year 1942 thats worth all your Expose's together. But I never hounded you for anything. And I dam sure never offered you a comic book for anything.

BTW, I have all the e-mail we exchanged archived.
If you need something to refresh your memory.

I use to have respect for you as we have exchanged info many times. But I don't know, you seemed to have changed at least towards me and I have done nothing to you.

You were the one who invaded my thread when I put up some Expose Splitter Software and Manual up for sale. That's rude to say the least. If you wanted to advertise your Exposes, You could have done it in your own thread.

I know where you got the NTSC Expose from but I'm not going to drag him into this. But I looked at that splitter before you did. But not the Main board.
And I knew you had this years ago. I do remember asking if you wanted to sell it. But thats as far as it went.

>
> Point is pretty moot. None of this hardware is manufactured any longer. Those that have it know what it can do. There is no need to re-write the book on NTSC or PAL video. If anyone here actually had an interest in one, they would have taken the time to find out what retail was on one and made an offer. They are cool if you are hard core Atari, but if you really want to do video on a computer, it isn't the hot setup.

Hey you jumped me, I just set the record straight.
Moot as in Debatable? Hell we can debate it till hell freezes over.
But Facts are Facts.

And if there is no interest in the Expose, why do you keep poping up everynow and then announcing that you have a couple then disappear. I've not seen you contrubute in this group for along time, only when one mentions the Expose.

And like I said before, you jumped into my thread were I had posted the Digitiser manual and software for sale.

If I had a discussion going about the Expose, that would have been different.

As for the Toad Catalog. Maybe they didn't have one. I have several. I knew the price. Here it is in case anyone is interested.

In the Ten Years of Tos Issue 1985 to 1995 Toad had a 2 page layout on the Expose and Apex Media. Pages 14 and 15.

The Expose Digitiser was priced $399.00
And Bundled with Apex Media it was $548.00

Actually not a bad price at $399.00 US for what it does if you get a NTSC version that works.

But I bet Mike will not sell ya one for $399.00 US.

If you have a PAL version, then you will have to figure in the cost for a PAL/NTSC VCR. Also you need the right power supply or you will blow er up.

But I doubt that mike really wants to sell. If he did why make someone look in
a old magazine for the price? Lame stuff.

And I doubt that he has 3 Pal Exposes. Unless he got them from David or from
someone overseas.
Pal Units were not sent here to be sold. I bought my NTSC expose From Toad.
And thats were the NTSC one he has came from. They were non working at the
time and toad was going out of business. Me and the other guy lucked into them.
My other Pal version came from overseas from a nice guy.

BTW, any other nice guys overseas that have a Expose or ScreenEye for sale, working or not working. Contact me.

If I could get enough of them, I wouldn't mind offering some up to Falcon owners
as I would like to see more Falcon owners have these and do some Video stuff with them.

I happen to collect all things Video Atari as its a hobby of mine.

My best advice for any US Falcon owner wanting to get into Video. Is get the
VideoMaster Falcon Cartridge. The Falcon only version. And if you can spring
for the Splitter, get it so that you can do TrueColor Still Grabs from a VCR or Camera.

I have 3 of them. Plus the ST/STe/Falcon one. I would not have 4 if they were not good.

The software uses the Falcons own Sound System to grab Audio in 16bits.

14megs is plently of room to do lots of Video with Audio Grabs. Since the Video is about 1/4 screen size this helps with the memory. And with the special PD display software you can make that 1/4 Screen Size into a full Screen and there are other cool effects like Pic in Pic. video running in 4 corners and etc. and is very easy to use. It's basically just something like a batch file and you select a number or letter for the effect you want and save it. It can be edited with any text editor. Also, there was a guy who made a program that did this for you. All you had to do was choose the effect you wanted and the program would make the control file. I have the program here. It makes it a bit easier.

The VideoMaster Software is very Cool. There is a ton of stuff you can do. To much to list here.

There is also a VideoMaster ST/STE/Falcon version of the cart. I have one of these. Its good for a ST/STE and has the Audio hardware built into the cart so that you can grab Video with Audio just like on the Falcon. Only its 8bits instead of 16bits to save memory. But it does a fairly good job and you can capture Color stills with a RGB splitter or the included 3 color films. The Falcon version has the color films also. But the splitter is much easier to grab color still with.

This version does work on the Falcon as well, But its really not as good as the Falcon only version. Although it does have some interesting software for the Falcon. That the Falcon only version does not have. But for the Falcon, the Falcon only version is the way to go.

To some Atari owners doing Video on their machines is cool and keeps them keeping on.   Alot of PC graphic software is almost exact copies of Atari stuff It's just looks different and with a few more options.

I have found nothing on the PC that is as good as some of the graphic software that I run on the Falcon. Even doing a simple slide show on a PC is a chore. And unless you have used Ataris first, you have no idea where your files are on a PC. Ataris are much better at file managment. Nothing gets lost. And seldom does one have to use a program to search for a lost file. You know whereit is on a Atari.

The only reason I have a NoteBook is to look at whats being stolen from Computers like Atari and Amiga. XP is like Geneva and NeoDesk in alot of ways. And I've notice similar features with other Atari/Amiga programs.

And also to see whats coming up next. I don't care much for Windoze but XP is closer to using an Atari than any version they have had so far. IMO.

Theres a old saying... Keep your Friends Close, But keep your Enemies even closer.

> Unfortunately, I won't go on either as I have forgotten more than you
> know about the subject.
>

Well, if you mean that, then I'll take it as a complement. As I try to stay ontop of the Atari things that interests me. But I'm not a expert on everything and I do make mistakes.

The scummvm port is probably more complicated and probably needs source changes. I know for somewhat FB driven systems, you need to forcefully set SDL full screen and some other stuff.

I'm trying to port ARAnyM to PXA270 ARM and Qtopia.. what a hassle ;-)

Thanks,
Mark

I think you are changing the subject, SWE was talking about the actual
machines, not their users.

>BTW: CT60 is also _NOT_ Atari!

Correct, it is an accelerator for an Atari. With the CT60 installed and
running at full speed, you will have the fastest Atari hardware
(including the TT-clones Medusa and Hades) available today.

Maybe it is possible to get any of the existing emulators  to run even
faster though, I would not know for sure. But that is clearly a
different question.

/Joakim

And I have to say, after booting up with the CD image of ARAnyM, and using both STeem and Hatari, that they are nice, they bring back a feeling of nostalgia, and yet...they're not the same as using my Falcon or my Mega ST.

IMHO.

Aranym on the appropriate PC is clearly faster in almost all respects
except RAW speed. JIT for instance can make ARAnyM whip a CT60 on things
like compression, encoding, decoding, encryption, playing movies, etc.

But on things that don't JIT cache well like compiling, there's NO
substitute to a CT60. (or a cross compiler ;-))

Thanks,
Mark

Sounds like Svideo if its 6pin ? The Atari pinouts are in the back of the book and you can look up Svideo on the net, just wire the Composite from the ST to the Svideo input on the monitor, thats how I connected my ST to my PC's graphics card Svideo input connector, its only 2 wires.

Chris

You burnt with a short circuit the internal trace from the L83 filter to the keyboard connector pin#4...

Here is the schematics :

+5V ---> L83 ----> Keyboard connector.

Just check if you get +5V on L83. (the middle pin is gnd !)
If yes, connect a good wire or a queue of a resistor between pin of L83 and pin#4 of keyb. conn.
You need only 1cm !
That's all !

Warning : this trace burnt here because it cannot burnt anywhere else ! It burn where it is the most easy to burn !!!
This mean that : if the trace is replaced by this stronger way (resistor queue or big wire), and if you do again a short-circuit, it will burnt somewhere else and maybe not at a good place...!

I have here a board from an italian guy :
It burnt inside the PCB between +12V and gnd...and the copper was fusionned and liquiefied inside the internal layer and touch now the +5v layer and some bus trace !
The PCB is dead !!! No way to repair that !!
The falcon mb is dead and just used for parts...

Regards

Fidel-Sebastian Hunrichse-Lara wrote:

> Define a Atari-system... & I show you whre you're wrong!

I will define it using an comparision: Hyundai is in every respect (speed, safety, bla bla) better as WV Beetle (which, like atari, has big base of fans), yet noone claims that hyndai with WV sticker is WV. Also, how many Hyundai, Fiats etc u can see on WV beetle shows, or how many of those drivers claims they drive a Beetle? So defining Atari system is fairly easy: Made by Atari. CT60 is indeed diskutable, but on other hand, all of the falcon subsystems still are operational, which we can not say for Aranym or MagicPC.

Note: i am strictly discussing what is an Atari and what is not. I do not debate what/which system is better and of some emulator or compatible users feel ofended, that's probably because they feel they that way, maybe ashamed a little ;). But saying that TT/Falcon ARE Atari's and Milan/Aranym are NUT Ataris, is NOT saying Milan/etc is crap or bad. Its just a fact. U can carry 4 persons, using same fuel, same tyres etc on any car, only one is Beetle. Why emulator/compatibles users feel ofended by that, is not for me to resolve. Probably a job for physiatrics...

> longer Atari-systems? No? See what I mean?

Nope. As i described it was an example. U can as well take any game that runs on ST or Falcon, DMA sound app etc, point is that CT60 (which is only CPU accelerator, all the original Falcon subsystems are still functional, and for example, few days ago i played Stardust on CT60) is fastest Atari machine. Magic_PC is faster, but lack shifter/videl compatibility. Aranym offers that as well, but at dramatic speed reduction etc.. And both, Aranym and MagicXX are not Ataris :) Fast or not fast :) Its like old saying: "its important to participate, not win". Of course, only loosers say that :) And Atari is not just OS and selected (GEM only) apps. Atari is whole package, soft and hardware, with all good and bad sides in one package.

I don't understand the logic of saying that once you plug something into the expansion port of the Falcon, its no longer a Falcon. Thats what the expansion port is for; expansion.

Going by that logic, if you plugged an Expose card (or anything else) into the expansion port, its no longer a Falcon either.

Doesn't make sense from where I'm standing... :-)

A quite old one. I don't have a working C++ cross-compiler, so maybe
someone could compile a more recent version using a ct60.

>BTW: 3,6 GHz P4 or 2,7 GHz G5 are actual machines!

Yes I cannot recall anyone objecting to that fact. Whether or not you wish to refer to such a machine as an "Atari" depends on if you are talking about compatible hardware or emulated/virtual hardware. The claim that Falcon+CT60 is the fastest Atari was for sure meant for saying that it is the fastest hardware available that was designed to run Atari software. Let's not misunderstand things on purpose.

>but it's as well an anachronism as a 286-MoBo with a K6-III 550MHz AT-Upgradeboard... isn't?

If you added a K6-III upgrade to a 286 motherboard, you would still consider it to be a PC I presume....?

Hello everyone,

I've run into an unexpected problem on my CT60 Falcon.

Occasionally on my stock Falcon (with NVDI 4) the Times and Triumverant (I know I'm misspelling the latter) fonts would have some strange behavior, but a quick "quit and restart" would solve the problem. On my CT60 Falcon (with NVDI 5) however, these two fonts place all characters over each other, making for an unreadable dark splotch. Other fonts look fine, and the program otherwise works normally. Does anyone have a solution, or at the very least a freeware substitute to these pesky CS fonts?

Galen

Hello,

If you are the owner of a CT60, would you kindly post about any SCSI based issues you are having? I'm having a devil of a time with my CDR, and I'm attempting to decide if I should keep spending my evenings trying to figure it out, or just buy an IDE CDRW and the appropriate adapter.

Galen

Patrice,

I am using the binary version from your website.

Coda, try using "monkeyega" instead of "monkey" if you are using the ST version of the game like I am. I suspect the ST version is the 16 colour version.

The two messages that appear are from the game itself, something like "Before we start..." "Please wait..." I don't have my ST here to run it.

Peter

I've just tried running it again using the command:

```
scummvm -p/d/games/monkey -enull  MONKEYEGA

Looking for monkeyega
Trying to start game 'Monkey Island 1 (EGA)'
Fatal signal: Bus Error (SDL Parachute Deployed)
```

It dislayed 1 screen that said "Wait..." in the style of the game graphics.
So I think the game is starting.

Peter

Ok I see. You may just want to check out the NET. I have seen websites that
will do custom made cables and adapters.

I was at the VGS this past weekend with my two sons. We all had a great time.
I must have spent over $130. I just wish the turn out was a little higher.

And now you easily play emulators on the PSP with the KXploit tool. I
have a NES emulator (NesterJ) on my PSP (has the 1.50 BIOS) with a
sh**load of games, including some Famicom Disk System games (you need
to have the Famicom Disk System BIOS, and it has to be named
disksys.rom).

Now if someone would just develop an Atari 2600 emulator for the PSP
(or a combo 2600/7800 emulator for the PSP).

Earlier today I tried running the windos version of SCUMMVM using
the Atari data files and it runs fine with monkeyega. It even bypassed the
security screen.

The DOS console window did report that the files were unrecognised
but they must be ok.

Could the Milan xbios be causing a problem ?

Peter

Hi Galen,

I'm not a CT60 owner yet, but I do have A CT2B and I did have issues
with the SCSI port.
It turned out that the version of HD Driver I was using was abit old. I
simply started using
Cecile thats included in the Flash and all my SCSI problems were gone.

My symptoms were like the SCSI drives were being accessed to fast and
were not setting up
with the rest of the system. Same thing on the CDrom and CDR drive.

I have a newer version of HD Driver now, but I've not tried it on the
CT2B to see if it works
correctly or not. But I think that it would. IIRC, Uwe changed some
things in HD Driver regarding
the Falcons SCSI system.

Do you still have the problems when you switch back to normal 030 mode?

IIRC, I had problems even when I switched back to the stock CPU.

If you are using a older version of HD Driver, that may be the problem.
But I can't recall what version I was using. Except that it was 7
something.
But that has been at least 2 years ago. So it was probably a very early
version
7.xx.

Other things that will affect SCSI drives are Termination. Also I have

found that
some Falcons like the CD-Rom/CDRW drives at the end of the chain.
Remember that some CD drives have terminator resistors. Some have a
simple
jumper that you can remove to enable or disable termination on the
drive.

I have seen some where you have to pull out the resistors. They are
usually long and in
two sets with pull tabs on them. They are in a single line socket, set
of two.
Most of these I have seen are the internal type of CDROM/CDRW that you
get and install yourself.

Extra long cables can also be a problem. Although I am using at least a
6 foot SCSI cable from
my CT2B Falcon to the Case were my drives are in. It works fine, but I
still want to get some
shorter SCSI cables.

Hope this helps in some way.

There have not been any issues for a long time, so I would expect it to
work (with HDDRIVER 8.1), indeed.

> Could the Milan xbios be causing a problem ?

Both scummvm and sdl used by it are now ancient and many bugfixes have
been done. Scummvm needs g++ 3.x to be compiled, and there is no working
version for MiNT (cross-compiler or not).

Hi Patrice,

Would a recompile of the old SCUMMVM with a new SDL be any better ?

It looks like he graphics might work but the sounds may be causing
problems. I have never got the sound working with PM-Doom either
so is this only an SDL issue ?

You're the expert on the compilers. Aren't some people using GCC 3.x ?

I'd really love to be able to play adventure games on my Milan. I miss
not being able to play them.

I will try a few other games and also try the -e pcspk option to see if
that works any better.

Regards,

Peter

CT60 works with HD Driver 7.60 and superior.
It cannot work correctly with <7.60 !

Sure the 8.1x is better, especially the last 8.12 or 13 (I do not remember)...

On 8.xx, I heart the SCSI processor must be disable...I do not know if it stills exact with 8.1x ...

But you have to understand that the software is not all and the hardware must be OK : if you have some lost of data because of a bad clock sync on SDMA, the driver will never fix that !

Regards

Finally got through just now. Took about 15-20 mins to resolve, using
Firefox here.

I'm trying to download - its showing the same slowness. Should be able to
get it though.

Thanks much! :-)

Do they actually work? What about the PAL issue? Does it work okay here in
the US with the NTSC standard?

Whats Toad retail pricing at these days?

Thanks.

Hi Odd,

The TOS/Mint/Magic bit should really have said TOS or Mint or Magic.
Obviously if an implementation works on more than one then it will
please more people.

I was trying not to restrict the Prize idea to any one OS or method
of implementation.

Good luck with the project and I would be glad to help with testing
if I can.

Peter

Think I offer my 2 cents as I know about the Expose.

(Mike I e-mailed you several times and got no replies)

If they are PAL then you would need sometype of PAL VCR in order to get
video
into the Falcon to digitize. If you wanted to say use a Video Camera,
It would have to be
PAL, unless it would work thru the PAL VCR. And I am not sure if this
would work.

I would think that you would lose Video Quality as you would have to
Transfer PAL into
NTSC. I assume the PAL/NTSC VCR would do this but I do wonder about the
quality.

Another thing I am not clear on, Is both the Splitter and the Main board
both PAL?
Or is it just the Splitter or Main Board?

Now, I am almost sure that I have a fix for the PAL Expos�'s, which will
turn them into
NTSC units. I have studied the Expos�'s for along time. And have done
modifications
to mine for better results.

If Mike wants me to turn a PAL Expose into a NTSC one, then I wouldn't
mind doing it.
But these days my time is money and I can't do it for free. And I gave
up giving out my best
discoveries for free after losing blood and sweat to discover them.

I don't mind helping out the Atari scene anyway I can. But the Expose' is one of those things that has a strange history. If I was a paranoid person, I'd say that they were sabotaged. Especially the NTSC ones. But I think they just didn't know how to make em work with NTSC. I do if any one interested. I studied Electronics at the component level and have a diploma that I am quite proud of.

I have 2 Expos�'s that are NTSC. One was converted! I can use any NTSC video device and digitize in all glorious Color. The last one I did is a small FLH Demo thats on FTP chapelie.rma.ac.be/atari/ It's nothing fancy, and I didn't take time to use the digital filters on it that would clean it up abit.

Next Demos I upload will be in the FLC 256 Color Format. So more Atari owners can see them. And, I will upload some VideoMaster stuff as well.

I have CDs full of Video stuff I've done with the Expose and VideoMaster Falcon.

I have 3 VideoMaster Falcons, thats why I offered up one for sale. To give someone with a Falcon a chance to get one of the best Video with Sound digitizers made for the Falcon.

I wish that more Atari owners would explore the Graphics and Video field of the Ataris.

Even a STe can do some suprising stuff. With programs like CAD 3D 2.0, Art and Film Director and a host of other great animation software.

One of my projects just happens to be a Video Digitizer. My main problem is that I am better at electronics than programming. But am slowly learning.

I could use some URLs for GFA with tips and some program examples to tinker with.

For the Atari ST-Falcon Computers to survive we need programmers.

One reason that the Atari 8-bitters are ahead with stuff like a USB cart is programmers.

There is no reason that machines like the STE, Falcon and TT can't use USB.

```
We really need to push programming. Some one with the time and knowledge
could start a
GFA Basic programming Newsletter that Atari owners could subscribe to.

I tell you now, that if we don't start programming ourselves, we are
going to wake up one day with
nothing new to use and no way to catch-up if the Net changes the way one
connects.

I'll hop off my soap box now.

First thing, I need a few normal STE type cables to connect to RGB type montors.

If anyone has any for sale/trade, do get in contact with me.

Now, I have a few questions about ST type RGB cables.

I am not sure if these were made but here is what I need.

I need a STE type RGB cable, normal ST connection on one end, on the other
end I need a round TTL RGB end. These have 8 pins. Where as a normal Lin RGB ST
Cable has 6.

I do have a few TTL RGB Cables with the proper Round Connection on one end, but they
have a Serial type end with 8 Pins on the other end.

Where any ST cables made with one end connection round with 6 pins and the other end
round with 8 pins for connecting into a TTL RGB port?

From the info I have, there doesn't seem to be much difference in the wire connections.

I need such a cable to connect a STE and or Falcon to a certain type of Monitor.

If anyone has such a cable for sale or trade, do contact me.

If there is a URL, that shows how to build such a cable, then that would help also.
But I would rather have the cable already made if possible.

You can still buy that one from a commercial dealer here in the US.

Hello,

Sound routines were still called, even with audio disabled. This is not the case in this new version, so running with audio off should be a bit faster now.

Hi all,

I was just using my falcon when the keyboard stopped working.

It's something on the motherboard because I tested the keyboard on another falcon and it works fine. I tested the connector on the motherboard on the keyboard connector where 5v should be and it's not there. I could not see a fuse or anything near the keyboard connector to check or replace.

Any ideas?
Rory

Hi all,

As an answer to my statement "aranym/AFROS a heap of shit?", Milan Jurik wrote to me personally:

> P.S.: Why should I support people like you? What did you do for Atari?
> Did you develop something interesting ever?

I never realized any support from M. J. because aranym isn't good for anything.
I have bought many Atari programs that do not work with aranym.
I have also made a Database of some older Atari Programs called "COMMENT" with Phoenix that you could download from the ST Computer homepage and created an Atari Bootdisk for x86 PC's with the Caldera DOS, a TOS Image, the TOSBOX Emulator and some essentials.
On the othe other hand his question is a little silly. If I buy some electronics from Siemens or so and become angry when it doesn't work nobody asks what I have done for Siemens.

> P.P.S.: Don't answer, it doesn't matter, all your e-mails to lists and
> newsgroups will be ignored by me forever.

If he had not ignored my emails, he whould have seen my following thread "aranym problem solved" where I have corrected my evaluation of aranym referring the compatibility of aranym with TOS 404. But the problem that

there is no useful Atari emulator for Linux remains (except perhaps the
game emulator Hatari) and so I must install MS Win 98 on my PC and buy a
proved Atari emulator for Windows. Sad.

regards, Ludwig

Oh, I didn't see the check you wrote to Milan. I guess typical programming consultant time is about $40-$50USD per hour (have to defray the IRS taxes). Multiply that times oh.. maybe 100 hours? Probably a lot more honestly. And you owe Milan $5000. Of course there's several other ARAnyM developers too. But they aren't charging.. it's free.

So when it's not perfect, they're not going to kiss your ass - YOU are supposed to kiss theirs at least somewhat!

>

Sad for you. Everyone else can use the advertised features of ARAnyM pretty well, and they at least understand not to bitch so loudly. Maybe you're used to buying software but things work differently in the free world. You have to respect people or they cut off support entirely to you. Oh well. I say serves you right.

You know, they care about compatibility issues and do solve bug reports one by one - but I can almost guarantee your only hope is to piggyback off off another more caring user's desires. If I was an ARAnyM dev, I would ignore you forever too. Your comments were way way way over the top. Sorry.

And if you read anything at all ever instead of being a lame idiot, you would realize ARAnyM is not an emulator but rather a virtual machine. Almost like Wine. It's made for PROPER MODERN programs. It's just not going to run 10 year old hack shit you throw at it, not unless workarounds and whatnot are implemented. It's NOT a perfect falcon emulator and probably won't be for some time. People snap screenshots of falcon games running on it because it's a pleasant surprise - not an expectation - not yet.

And since it's a falcon emulator, it's even less likely to run the shit that won't even run on a REAL modern atari like a ct60.

Anybody would have been willing to nicely explain things to you, and the docs explain things at least marginally well. Open source projects always

have docs that aren't perfect. But when you have such an attitude, you're
going to lose. go bother the ASH people.. They can have you.

Fact is you have expectations in a place where you should have none. It's
like homeless motherfuckers in philly that get pissed when I give them
$0.25 instead of $1. They don't know my situation or how much I
can afford to give. They're lucky they got anything at all! And now...
They DON'T!

Ok I think I'm done with my rant, and I'm sorry if I offended other
friends here.. but this is just my humble opinion.

Mark

Ridiculous calculation. 5000$? The price of
MagicMac was only 250 DM and it worked.
And of course I do not write cheques to people who announce not to read
anything from me.

> So when it's not perfect, they're not going to kiss your ass - YOU are

One year old papyrus X doesn't work with aranym even with NVDI 4 installed instead of fVDI.

> And since it's a falcon emulator, it's even less likely to run the shit
> that won't even run on a REAL modern atari like a ct60.

The ct60 is no modern atari. Now, it is a part of an old computer that makes it running at perhaps 1/10 of the speed of a modern computer for the price of a complete modern computer. Some years ago I mailed Mr. Czuba some interest for a complete computer with a ct 60 for 999 DM but he refused. Silly idea to produce accelerators for rare computers that can only bought second hand.

> But when you have such an
> attitude, you're going to lose. go bother the ASH people.. They can
> have you.

They already have me and never felt bothered or were too polite.

> Fact is you have expectations in a place where you should have none.

Of course I had some expectations about aranym after so much loadspoken promises.

regards, Ludwig

For their free effort for a good product - do you hear anyone else chiming in complaining? When people start bitching about MagiC everyone else chimes in to say how much it pisses them off too. When I pay good money for an OS I expect it to be perfect. When I get something for free I expect problems - shameful that it's pretty much the exact opposite - not just in the atari world either! (and always exceptions.. No free programs beat Papyrus or Tempus Word, etc. None that run on an Atari anyway)

>> And if you read anything at all ever instead of being a lame idiot, you

I'm pretty sure this is bunk. Maybe it doesn't work with XaAES or something. I don't have Papyrus X so I don't know, but I know older versions work.

The CT60 is the MOST modern atari available. How can you say it's not a modern Atari. It's the fastest the ATARI world gets! I mean if you're dreaming about computers that don't actually exist, sure. And the price is about right for a limited run project. We've been through all this before. Rodolphe could charge $500USD for CT60 and people would pay it, but he doesn't.

But you complain about the bolt "duct tape" nature of the CT60, but it's an assload faster than Hades or Milan. With SuperVidel and a PCI bus eventually, no matter how ugly it may look physically, it will be the best available.

>> But when you have such an
>> attitude, you're going to lose. go bother the ASH people.. They can
>> have you.
> They already have me and never felt bothered or were too polite.
>

Well this doesn't make any sense at all.

>> Fact is you have expectations in a place where you should have none.
> Of course I had some expectations about aranym after so much loadspoken
> promises.

They do promise some things that aren't actually true, or maybe are true but with exceptions. Regardless, you have no rational reason to behave like a 12 year old child when you don't understand how to get it working. Fact is most everything they promise does work but not every part of it is simple to get working.

I think I figured you out. You must be the type that uses money to solve all your problems. Dealing with commercial vendors, they're paid to deal with pretty much any bad attitude in order to make you happy. That's akin to being a whore or a prostitute.

Well it's pretty cool you found a group of people who aren't your whores. A group where your money doesn't matter. All you have left is your social skills... or lack thereof.

Anyway, since you're defending your prior words and you've made several additional strikes since your initial comments, I'll no longer be responding to you. You can tell by how little activity your threads get that other people don't like you much either. Oh well.

Mark

Well an easy but improper way would be to solder a wire from another 5V source to it. If you probe the board in that area (+ end of big capacitors) you can find another source. You must have had a short or something adn there must be a fuse or something blown. Rodolphe would know best.

Thanks,
Mark

Hi Rory,

I think it may be the same issue as was discussed in this old thread:

http://groups-beta.google.com/group/comp.sys.atari.st/msg/a1ca52fb18919bec?fwc=1

I have had the same prob you are seeing, and managed to take 5v from
another source. Not 100% sure it was the exact same pin as is described
in the posting that the above URL is pointing to.

Regards,

/Joakim

It is way much more fun to play Doom without sound enabled, compared to
see the Falcon crashing ;)

Hopefully Patrice will have this sorted out soon so we can all play
this game in its full glory.

Regards,

/Joakim

Hello Patrice,

My Hades uses the same TOS as a TT:

TOS version : 3.06
GEM Dos version: 0.19
AES: 3.99
Language: German

Well if you do not mind Mono, you can buy an adapter that will allow direct hookup to a VGA monitor. For Color I use a piece of hardware called "Video Key" and a video converter. Both work great and allow my STe to be hooked up to a SVGA monitor.

Does anyone know if ICD host adaptors are still available? Or is there a
spare one floating around? The one I am using has failed and need to get
my hard drive working again to recover some files.

Thanks

Ric

100mhz wont, faster bus will. i will improve IDE acces a LOT, altough prolly not to Hades values.. However, CT60 compile GCC sources faster as Hades, even with MP3 playing in background... faster HDD doesn't help much without the rest, even when dealing with a lot of HDD acces (gcc). There is speed and there is speed :) Hades is, on other hand, faster with GFX display.

> As for the thread, the guy came back and corrected his evaluation.
> What more do you expect? Your replies seem slightly over the top as well.

Personaly, i don't think "ups i was a bit angry, im sorry" its not enough after post that dude did. when one reacts as he did, its personality problem... But i wont even bother to respond...

We need an IDE card that sits on the CT60 bus. The question is - how
many cards can the CT60 bus handle (after supervidel and ethernat) from
a signal quality point of view?

Gerhard,

Where in TOS .HYP did you find this? I can't find it in mine. Or is yours a different version? Mine is 1.70 by Zorro according to the Info panel.

The listing above is, of course, incomplete since most of the TOSs were available in many language versions. (See for instance the chip numbers listed in the Chips 'n ChipsX Index: 'TOS Versionen').

Regards, /Peter/

A decent 6 slot PCI bridge would solve this for us ;-)

  Of course. PC/M_PC is NOT Atari... And for example: a stock Falcon
can run Apex (or ACe or a lot of apps) at speed, lets call it speed 1,
M_PC does not even run those apps.. define speed now ;)

Hi Rory,

If you take 5v from another source and it makes the keyboard work then it may be alright to use it like that.

However, If possible I would try to discover what caused the problem as another part of the Falcon may also be affected by this problem.

If you are not getting power at the pins were the keyboard connects to the motherboard. It is possible that you have a broken solder joint under one or more of the connecting pins.

You could try carefully moving each pin and see if any seem loose. And if you want to do a more careful look. Take the case apart and look under the board were the pins are to see if you have a broken solder joint.

If all seems well then we need to find out where the tracks of these pins goes to next and look there for trouble.

If you have the case apart or have the proper Falcon diagrams, then we could track them back to the next component and so on.

However I feel that its probably a broken track or bad solder joint, like what happens with the Mouse and Joystick ports. The solder joints get worked loose from unplugging the mouse and joysticks.

If you have done work on your Falcon before and have removed the keyboard a few times. It could be the same thing.

If you have a soldering Iron and some solder, and the time. I would go over each joint and see if that fixes the problem. If it doesn't, then thats one thing out of the way.

Generally thats how you fix problems like this, unless you know for sure whats causing it.

You eliminate what could be causing the problem and whats left is usually the problem that needs fixed.

If you do go for the 5v fix from another source. Just notice if you have any problems with any programs when running the machine.

Do you have a list of the ones left in the US?

What happened to Chromagic and Systems For Tomorrow?

I never did hear a official closing statement from them.
And I use to buy alot from them both.

I have Video Key and Monitor Master and the Mouse Master all from the
same company.

With the 1040STe and its Composite Output, I could just use it and the
Stereo Sound Jacks.

But thats not the way I want to go.

I will probably have to make my own Cable, which wouldn't be hard as
both the ST RGB 6 Pin
and the IBM RGB 8 Pin are just about the same. They just use a
different connector.

I would already have done this, but I don't want to use the only ST RGB
Cable that I have.

So if anyone has extra ST RGB cables, or a ST RGB Cable to 8 Pin RGB
contact me
at:

phantomm@bellsouth.net

In the mean time, I'll search a few sources I know of.

Thanks,
Phantom

Chromagic is still around (see below), and Systems For Tomorrow has a web
page, http://www.systemsfortomorrow.com/ but it appears to be dead.

> I never did hear a official closing statement from them.

So did I! :-)

http://spythis.com/mpc/
http://chromagic.digistar.com/store/newitems.htm

E-mail Jim Collins, its how I got my last Moving Pixels CD.

>>into the Falcon to digitize.
> Yup, that helps.

It's about the only way it could work as in the US NTSC is the Standard.

>
> The Aiwa unit works perfectly. It converts the signal digitally, there
> is no "loss" or artifacts.

The Quality I am refering to is the difference in PAL and NTSC.

The Frame Rates are at different speeds.

Most of Europe and the UK have a frame rate of 50HZ the highest
frame rate is around 25 frames per second.

In the USA we use 60 HZ which translates into 30 frames per second.

If anyone has a VideoMaster, it works in both PAL and NTSC.
If you are in the USA press the Function 10 button and see what happens.

The size of the Screen of the program will drop down in size.

Now, APEX MEDIA has a PAL and NTSC option in the Video Section.
It doesn't work on a VGA, but it does on a RGB monitor which gives you
the
best color display options to work in and it will make a difference in
the size
of your Video if you are using PAL or NTSC.

>>

>>board
>>both PAL?

>>Or is it just the Splitter or Main Board?
>
> The NTSC splitter accepts NTSC video only unless modified. No big
> deal, it's a pretty straight forward converter.

I think you are wrong here. The NTSC Splitters have a adjustable
NTSC HUE Control on the back of the Splitter. PAL Splitters do not
have this option. My NTSC Splitter does have the Hue Control.
And I have a PAL unit that does not. But I have a fix for this.

If you think I am wrong, check the Expose Digitster manual Page 16.

> The PAL Expose accepts 50Khz RGB video at horizontal 15.75 Hz (it

> the Expose using RGB outputs.

PAL is 50 HZ last time I checked.

 The Falcon, Jag and ST's can easily
> output that mode, so capture from them is easy. Since there are no
> schematics available, I would be leery of modifying one as I already
> have an external solution with the dual standard vcr.

Sure they can output that mode or they would not work overseas as
PAL is standard over there. But there is a difference in the Screen Size
which will also effect any video that you digitise. It will be smaller
than
a NTSC unit.

I am not sure how the PAL unit will look on a VGA.

Have ya ever played a ST game on a RGB monitor that needed a
50HZ boot program to put the monitor into 50HZ before the game
could be played. I know some of you out there have. Do you remember
that the screen size of the game dropped down in size over normal
games that don't require the 50Hz boot program? Some overseas games
do this automatically.

> The PAL guys overseas should be able to answer those questions. I
> think they call them SCART cables over there, and would allow most any
> video source to connect to the PAL Expose.

Thats fine for the UK and overseas but SCART isn't a standard here.

> Some of the stuff in this link is old, but it explains how they
> managed to screw up NTSC video years ago.
> http://en.wikipedia.org/wiki/NTSC

I will check out this link and see.

I have a few long talks with Doug Little myself (Programmer of Apex
Media)
Also David of Titan Designs has told me a few things in his own way.

However, Those e-mails will not be released by me. Mostly out of respect
for Doug.

> I have no interest in converting mine.

Toad Computers wasn't in Oregon. They were the official distrubitor of
the
Expose and there Techs did work on them.

One of the main reasons that the NTSC EXPOSE would not work over
here in the US was simply due to the Power Supply.

The US units did not come with a PowerSupply because UK power supplys
are different. Some folks bought the wrong powersupply hooked it up to
the splitter and blew the splitter and it some cases the main board.

It takes a special type of Powersupply to get a NTSC Expose working.

And there are a few other simple mods one can do to get better results.

> Splitter or Main Board?", then you say you have converted one.

I'm glad that I am amusing you.

I was asking you if your Expose Splitters are all PAL and if
all of your Main boards are PAL.

There are differences in both. I don't know where you got your Expose's
at

so you could have a PAL Splitter with a NTSC main board.

>
> I would hope you would know if your offering to modify them for
> people :)

I know which boards are Pal and the ones that are NTSC as for
the Splitters, thats easy, just look on the back for the NTSC HUE
Control
that you must don't have.

>

> the 040 however. So your limited to a 14meg Falcon max, and black and
> white video.

Not really true. The video isn't just Black and white. You have several
Color Scales to chose from. such as Red, Green, Yellow, Red, Sepia,
and the normal Grey Scales and all of these are in 256 color scales.

And you can always inport 256color pictures to form a true 256 color
video if you take the time to do it. Also there is the excellent Audio
ability. Which is 16Bits IIRC. The Video and Audio is grabbed together
and when you play it back, the sound is played right along with the
video.

You can then save these movies out in several formats. There is even
a PD player to give out with your films. And it has some special
features
that you can do to the video thats pretty amazing.

Its the only VideoDigitiser for the Falcon, that will grab Audio or
Music with
the Video at the same time. And if you just want to grab Audio and mess
around with it. There are plenty of options to do lots of things.

With the RGB Splitter you can Grab TrueColor Stills from a VCR or
Camera.

The only funny thing about it, is your lack of knowledge of how to use
it.

It was rumoured that a 256color version was in the works. I know it can
be
done. And thats all I am saying about that.

Hi all,

I ran 5v from another point and the keyboard lit up. However the keyboard is sending keystrokes to the motherboard, but they are not registering to the motherboard. The HD spinup bar will shrink to nothing despite pressing the keyboard. The keyboard is good as it works on another falcon. I think there might something a little more serious. Rodolphe any ideas or should I send the board? 68B50?

Thanks,
Rory
